

**Cryogenic Tank Options  
for a New  $0\nu\beta\beta$  Experiment  
in Hall A of LNGS**

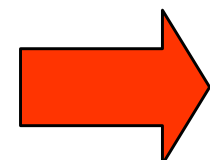

**Karl-Tasso Knöpfle**  
**MPI Kernphysik – Heidelberg**  
ktkno@mpi-hd.mpg.de

# New Ge-76 $0\nu\beta\beta$ Experiment (1)

- **Goal**

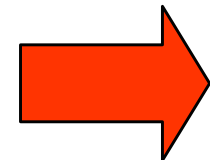

Reduce external background at  $Q_{\beta\beta}$  by 2-3 orders compared to Heidelberg-Moscow experiment :

  $10^{-3}$  to  $10^{-4}$  cts / kg keV y

- **Idea** (G.Heusser, Ann.Rev.Nucl.Part.Sci. 45(1995) 543)

Operate bare Ge crystals in pure liquid nitrogen (LN) !  
Choose LN volume such that external background (10 Bq / kg Th-228: 2.6 MeV  $\gamma$ -rays) is reduced to desired level !

- **Needed**

  $10^{-3}$  cts / kg keV y :  $\emptyset(\text{LN}) = 11.5$  m  
 $10^{-4}$  cts / kg keV y :  $\emptyset(\text{LN}) = 13$  m

# New Ge-76 $0\nu\beta\beta$ Experiment (2)

- **Constraints**

available space  
in hall A of LNGS  
 $\text{Ø}=12\text{m}$ ,  $H=11\text{m}$

- **Solution**

combine  
conventional Pb/  
water and LN  
(LAr) shields

hall A of LNGS

# Optimize !

size

safety

cost

equivalent shielding thickness

cost per eq. shielding thickness

lead

+

# Options

odd #:  $10^{-4}$  cts/..  
even #:  $10^{-3}$  cts/..

- Additional constraints

radiopurity of materials prevents free mix of building materials

## options 5 - 8

5&6 / 7&8: LN / LAr thickness such to shield steel and isolation of 7 mBq/kg

## options 9 - 12

9&10/11&12: LN / LAr thickness such to shield lead of  $30 \mu\text{Bq/kg}$

# Option 6 / 10

contour of hall A/B

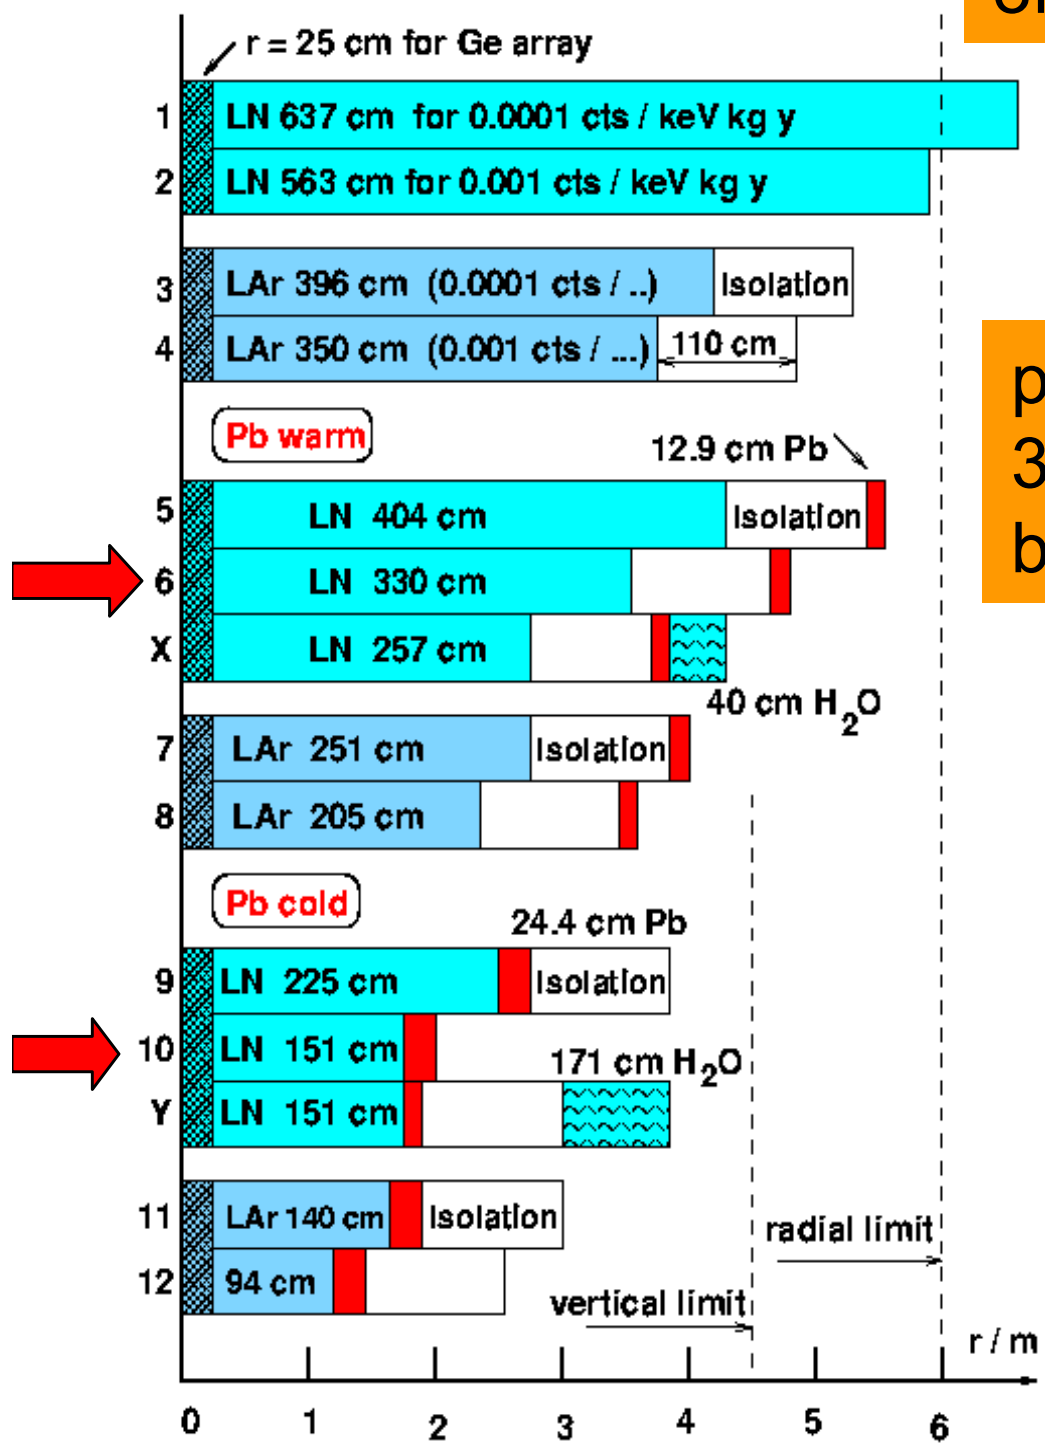

off the shelf flat bottom tank

perlite isolation of 35 Bq/kg replaced by e.g. styrol

Ge diodes

foam glass 10 Bq/kg (like LNGS concrete)

→ option 10 + neutron absorber in cold volume

# Options

odd #:  $10^{-4}$  cts/..  
even #:  $10^{-3}$  cts/..

- Additional constraints

radiopurity of materials prevents free mix of building materials

## options 5 - 8

5&6 / 7&8: LN / LAr thickness such to shield steel and isolation of 7 mBq / kg

## option X

activity of steel and isolation assumed to be 0.7 mBq / kg

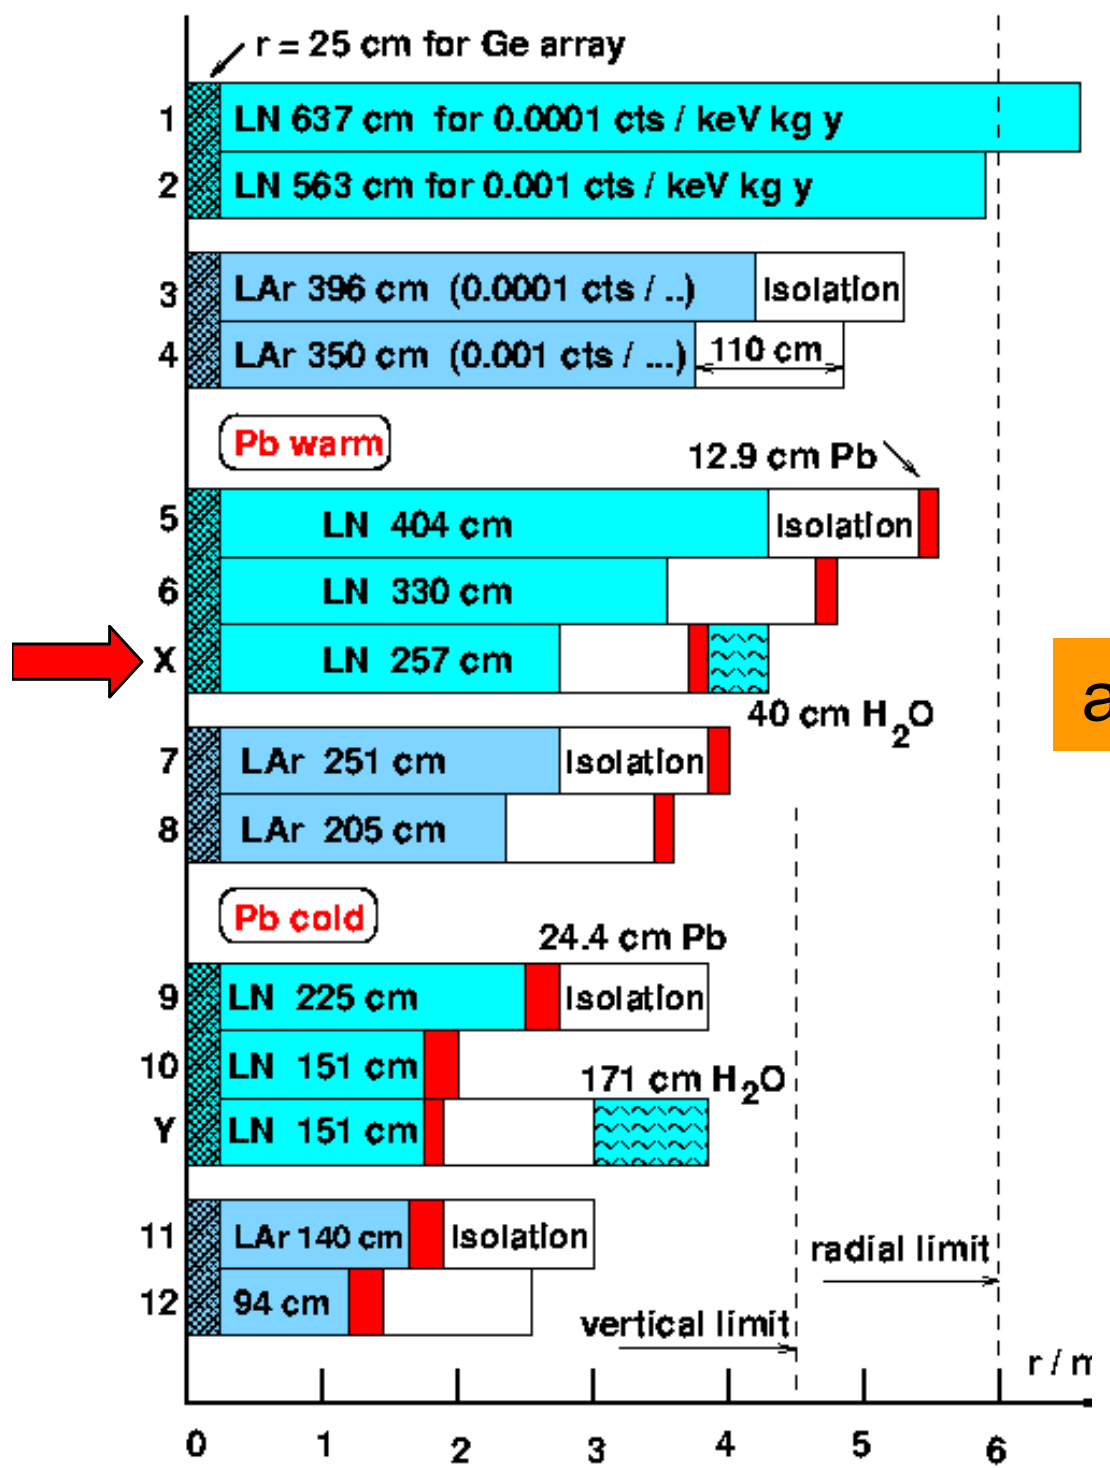

LN thickness can be reduced by 73 cm – missing LN is substituted by 43 cm thick water

# Option X

contour of hall A/B

off the shelf flat bottom tank ?

all lead 'warm'

Ge diodes

radiopurity of inner wall and isolation less than 700  $\mu$ Bq / kg

water also neutron absorber and Cherenkov medium for  $\mu$ -veto system

# Options

odd #:  $10^{-4}$  cts/..  
even #:  $10^{-3}$  cts/..

- Additional constraints

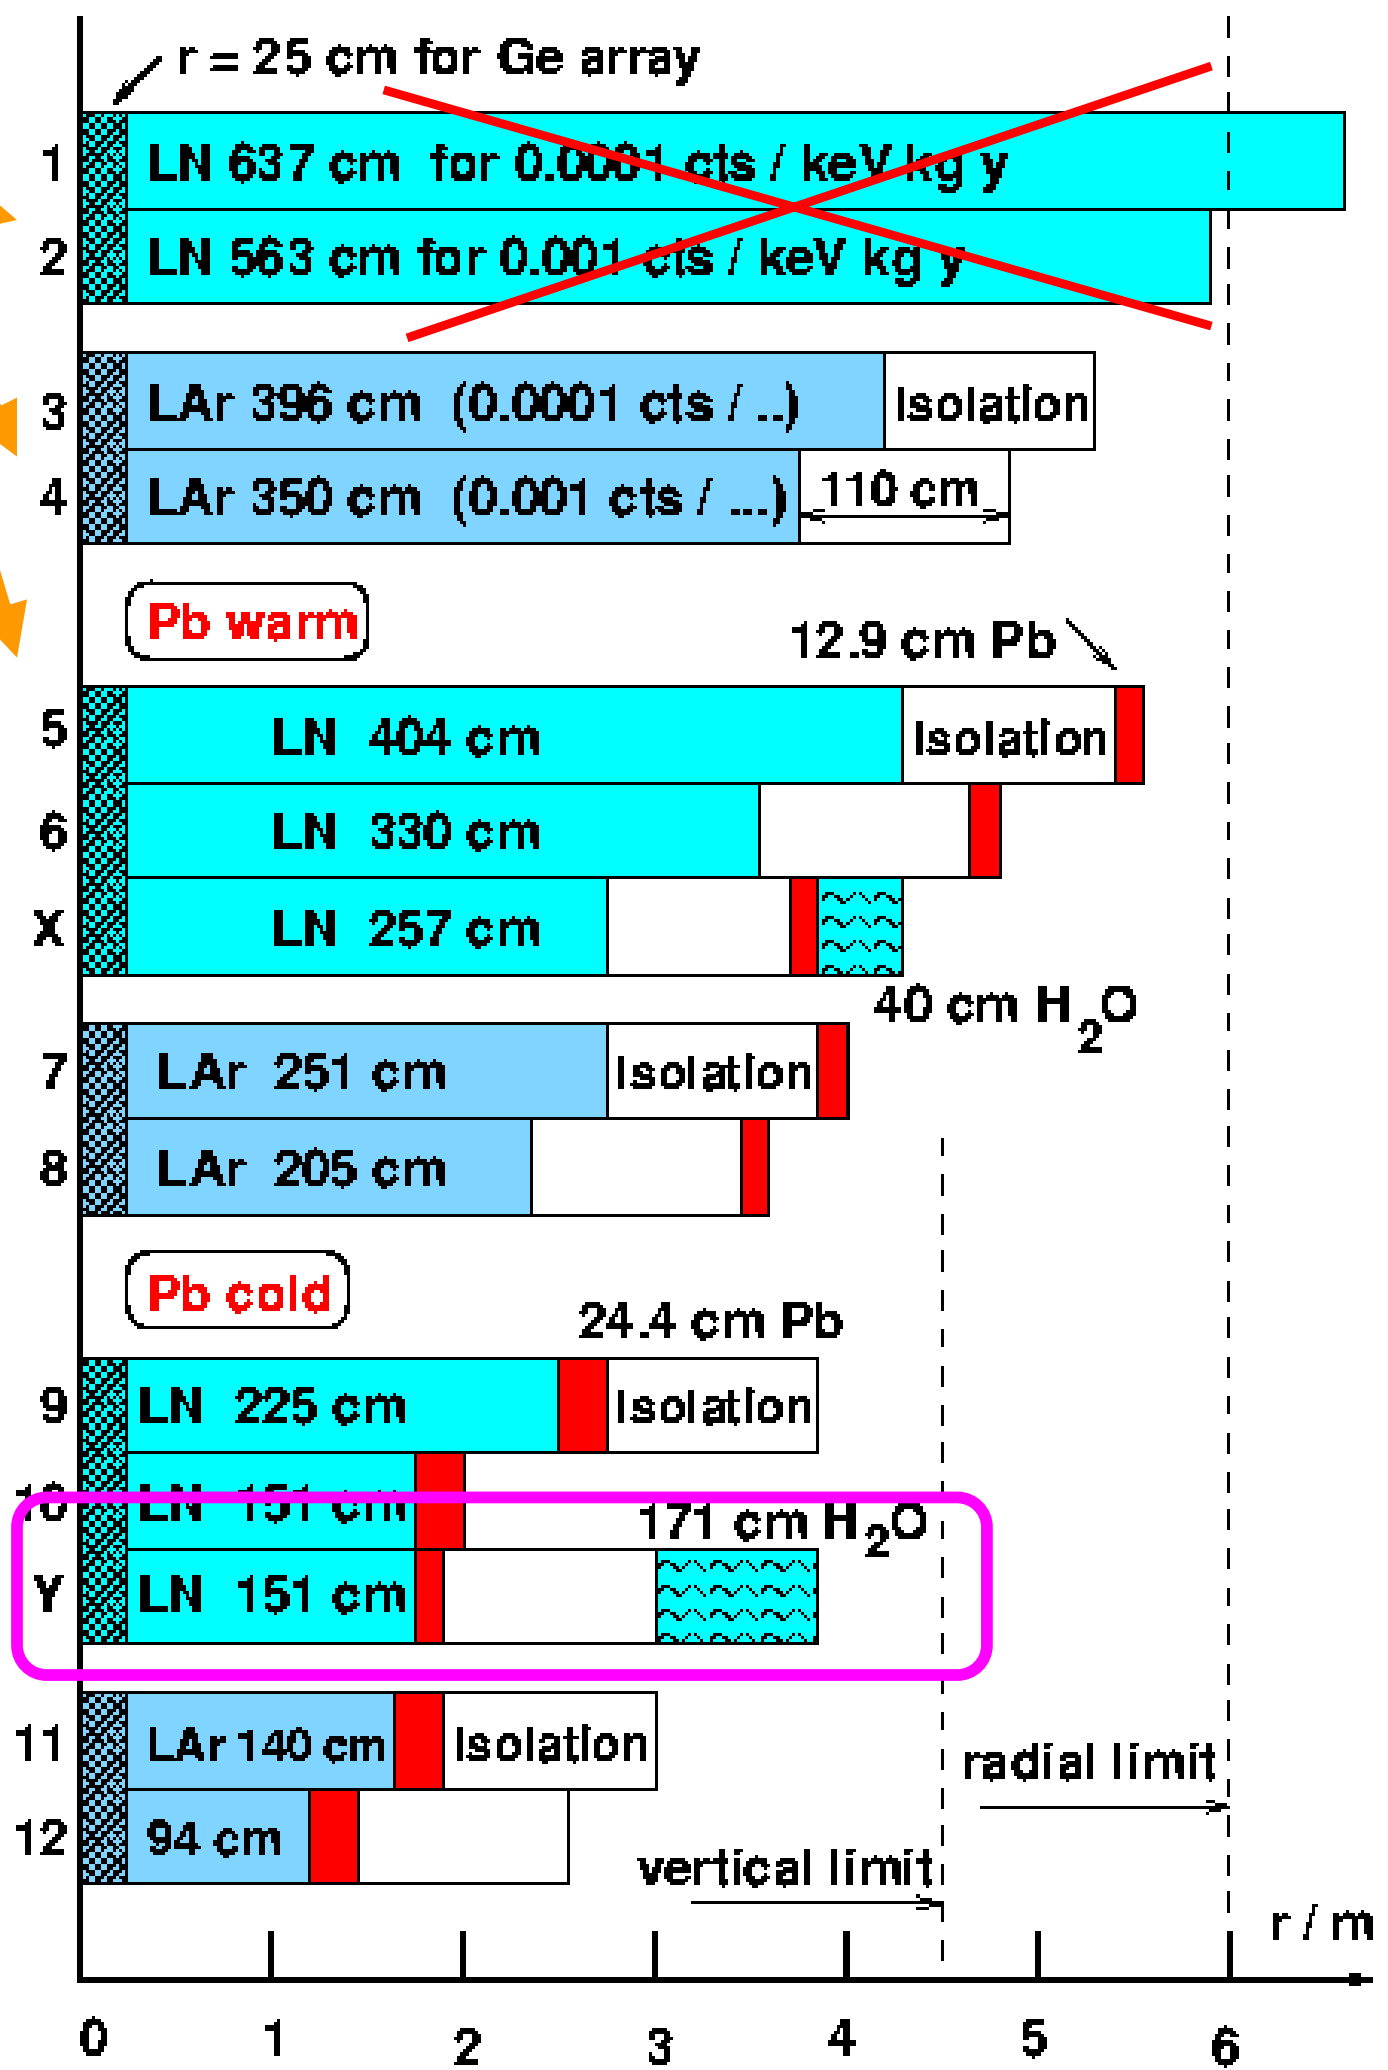

radiopurity of materials prevents free mix of building materials

options 9 - 12

9&10/11&12: LN / LAr thickness such to shield lead of  $30 \mu\text{Bq/kg}$

option Y

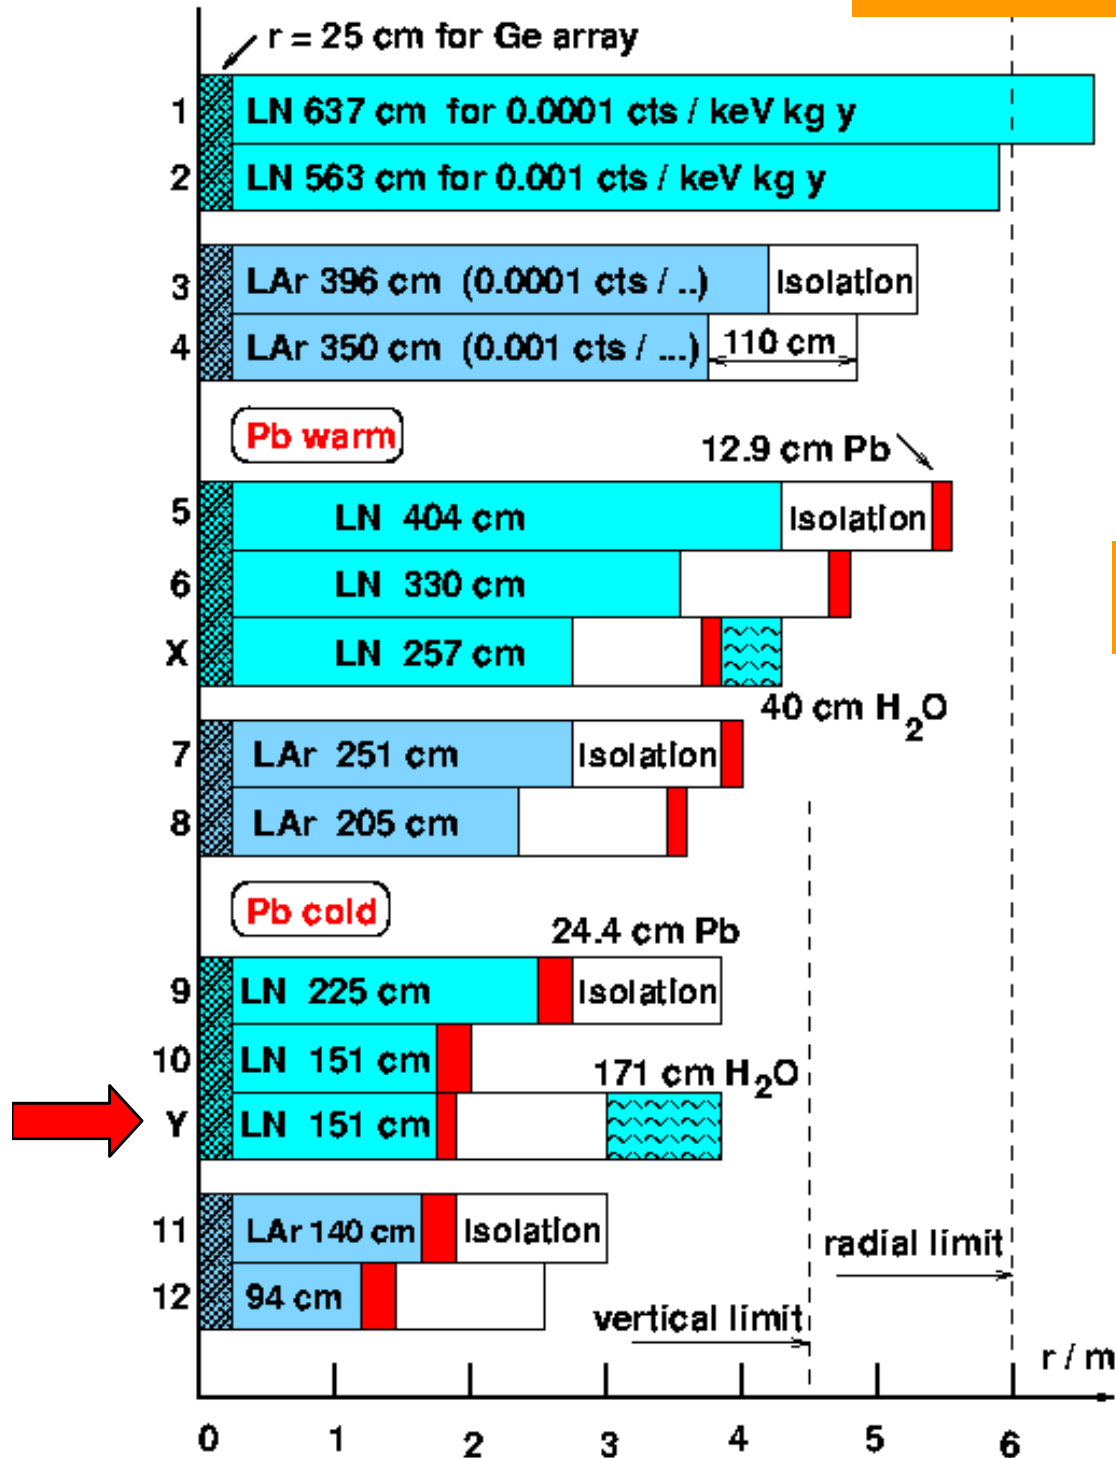

Lead thickness reduced to shield only steel & isolation ( $7\text{mBq/kg}$ ) - missing lead substituted by 171 cm thick water layer

# Option Y

custom-designed cryogenic vessel:  
needs to carry internal Pb load

contour of hall A/B

all lead 'cold'

thickness of insulation  
can be reduced: e.g. by  
evacuated powder

water also neutron absorber  
and Cherenkov medium for  
μ-veto system –  
water thickness can be tra-  
ded against lead thickness

# Two Previous Proposals

## GENIUS

## GEM

# Comparison of Options

option: **6 / 10**

**X**

**Y**

**GENIUS /  
GEM**

<b>Ø x H</b>	ca.: <b>10 x 11</b>	<b>9 x 11 [m x m]</b>	<b>10 x 10</b>	<b>14x19 / 11x11</b>
<b>LN / LAr</b>	<b>210 / 178</b>	<b>174 [m<sup>3</sup>]</b>	<b>34</b>	<b>1250 / 50</b>
<b>Water</b>	<b>0</b>	<b>145 [m<sup>3</sup>]</b>	<b>500</b>	<b>0 / 1000</b>
<b>Lead</b>	<b>550</b>	<b>500 [tons]</b>	<b>100</b>	<b>0 / 0</b>

# Conclusions (1)

**Cryogenic vessel with required shielding power against external  $\gamma$  background can be built and will fit together with neutron absorber and  $\mu$ -veto system into hall A of LNGS.**

**For economy, the background level of  $10^{-4}$  cts / kg keV y is obtained only with a LAr fill.**

**A LN fill provides 10 times worse background level.**

**Trade-off between shielding materials LN / LAr / lead against water yields space and cost effective system since the water shield will also serve as neutron absorber and Cherenkov medium for the  $\mu$ -veto system.**

**Evaluation of different options in contact with industry.**

# Conclusions (2)

13 cm thick Pb shield

- foam glass 10 Bq/kg

perlite isolation replaced by e.g. styrol

## Option 6 / 10

+ off the shelf flat bottom tank with its perlite insulation replaced by e.g. styrol.

IF foam glass cannot be replaced THEN

- part of Pb and neutron absorber in 'cold' volume
- extra neutron absorber and  $\mu$  veto system needed

ELSE

+upgrade to option X with integrated neutron absorber and Cherenkov medium possible

# Conclusions (3)

11.5 cm thick 'cold' Pb

cleanroom / lock / hoist

evacuated powder isolation has half the thickness – superinsulation even less!

water thickness can be reduced if lead thickness is increased

## Option Y – all lead 'cold'

- + compact inner vessel - no need to be built underground
- + small LN/LAr volume → safety → 'easy' exchange LN - LAr
- + integrated neutron absorber & Cherenkov medium for  $\mu$ -veto
- + standard radiopurity materials
- + trade-off between water & lead thickness possible

! thermal isolation of high load  
! neutron flux at diodes affected by 'closely' neighboured lead ?
