Summary of TG11 parallel session  
(Yesterday, 17h<sup>00</sup> – 18h<sup>45</sup>)

Italy – Australia

1 : 0

# Activities since Heidelberg meeting

- ◆ Further gamma spectroscopy screening measurements (focus on stainless steel)
- ◆ ICP-MS measurements
  - of steel / superinsulation foil in Russia
  - of polymeric films at LNGS (talk of S. Nisi)
- ◆  $^{222}\text{Rn}$  emanation measurements
- ◆ Cu surface cleaning studies (from  $^{226}\text{Ra}$  and  $^{222}\text{Rn}$ -daughters)
- ◆ R&D: Lucas cell with improved sensitivity

# Stainless steel measurements

- ◆ 3 samples measured:
  - for PMT encapsulation (from Tuebingen)
    - ◆ only  $\gamma$ -spectroscopy
  - 1.4429 from Acelor (same as used for KATRIN spectrometer)
    - ◆  $\gamma$ -spectroscopy and ICP-MS
  - AISI 321 (Outu Kumpu)
    - ◆  $\gamma$ -spectroscopy and ICP-MS
- ◆ Matthias L. provided long list of samples measured previously at LNGS

# Stainless steel measurements - [all numbers in mBq/kg]

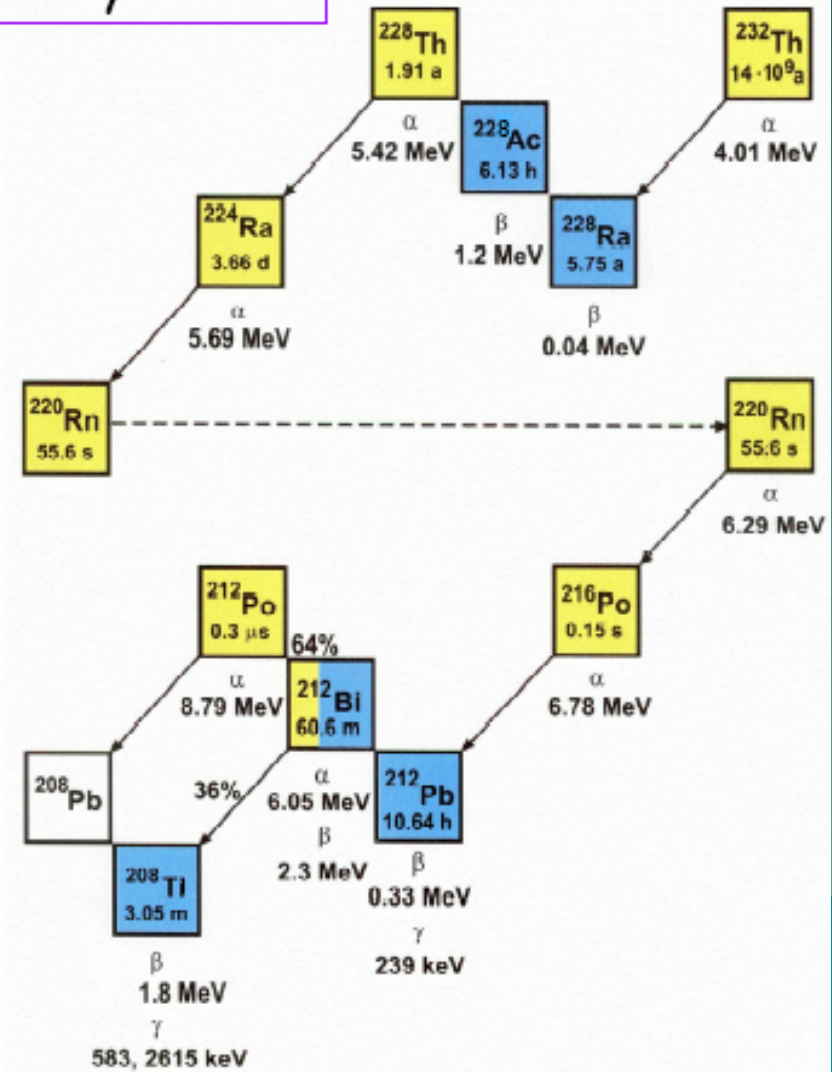

| Isotope                       | AISI 321<br>Outu<br>Kumpu | for PMT<br>encapsulation | KATRIN steel<br>1.4429 |
|-------------------------------|---------------------------|--------------------------|------------------------|
| $^{228}\text{Th}$<br>$\gamma$ | < 1.7                     | $2.2 \pm 0.4$            | $5.0 \pm 0.4$          |
| $^{232}\text{Th}$<br>ICPMS    | 0.5 - 0.9                 |                          | 20                     |
| $^{226}\text{Ra}$<br>$\gamma$ | < 1.6                     | < 2.6                    | $2.0 \pm 0.4$          |
| $^{238}\text{U}$<br>ICPMS     |                           |                          | 2.7                    |
| $^{60}\text{Co}$              | $4.0 \pm 0.5$             | $17.6 \pm 0.3$           | $4.1 \pm 0.2$          |

# $^{228}\text{Th}$ decay chain

$^{232}\text{Th}$  → ICPMS  
 $^{228}\text{Th}$  →  $\gamma$  spectrometry

## $^{232}\text{Th}$ decay chain

Even if the  $^{228}\text{Th}/^{232}\text{Th}$  activity ratio is disturbed by chemical treatment (removal or addition of  $^{228}\text{Ra}$ ) this ratio can never drop below 0.7  
 → the  $^{228}\text{Th}$  activity must always be greater than 70% of the  $^{232}\text{Th}$  activity

# Stainless steel purity

228Th in various steel samples

# Some more $\gamma$ -spectroscopy results

- ◆ Superinsulation foil (Austrian Aerospace)
  - $^{226}\text{Ra}$ :  $1.1 \pm 0.4$  mBq/kg
  - $^{228}\text{Th}$ :  $2.3 \pm 0.6$  mBq/kg
- ◆ Pogo pins:
  - high in uranium ( $\sim 10$  Bq/kg level), but low in radium ( $< 80$  mBq/kg)
  - but high in thorium (430 mBq/kg)

# $^{222}\text{Rn}$ emanation: Copper foil

# $^{222}\text{Rn}$ emanation measurements

- ◆ Stamped copper foil (200m x 0.3m x 100 $\mu\text{m}$ )
  - purified by rinsing just once with quartz-distilled water
- ◆  $^{222}\text{Rn}$  emanation rate reduced by 30%
- ◆ Further samples for GERDA lock:
  - no major  $^{222}\text{Rn}$  sources discovered
- ◆ talk by Ingo Wiesler in TG11 session

# Cu surface purification studies

- ◆ LENS electrolytic copper used to fabricate sample discs (50 mm diameter, 1 mm thickness)

- ◆ Discs cleaned applying "Majorana procedure" (5 min in 1%  $\text{H}_2\text{SO}_4$  + 3%  $\text{H}_2\text{O}_2$ ; 5 min in 1% citric acid; rinsing with distilled water)
- ◆ Discs placed for 4 months in a strong  $^{222}\text{Rn}$  source (1.4 MBq)

# Comparing etching with electropolishing

- ◆ Amount of removed material:
  - after 7 “Majorana” runs (30 min): 20.9 mg/cm<sup>2</sup>
  - after one polishing run (35 min): 5.7 mg/cm<sup>2</sup>
- ◆ Amount of removed <sup>210</sup>Po activity:
  - after 7 “Majorana” runs (35 min, 20.9 mg/cm<sup>2</sup>):  $R_{av} = 2$
  - after polishing (1 h, 4.5 mg/cm<sup>2</sup>):  $R_{av} = 30$
  - after long-polishing run (3 h, 20 mg/cm<sup>2</sup>):  $R_{av} = 187$
- ◆ Amount of removed <sup>210</sup>Pb and <sup>210</sup>Bi activity:
  - one “Majorana” run (5 min, 3 mg/cm<sup>2</sup>):  $R_{Bi} = 40, R_{Pb} > 68$
  - electropolishing (1 h, 4.5 mg/cm<sup>2</sup>):  $R_{Bi} = 240, R_{Pb} = 1000$

# R&D for improved Lucas cell

- ◆ Conventional Lucas cells have some limitations due to
  - light loss (no reflectivity)
  - high U/Th concentration in ZnS
- ◆ VM 2000: reflecting, pure scintillator
- ◆ Status:
  - Prototype is working
  - Discrimination between  $\mu/\alpha$  still poor
  - Improvement expected by TPB coating
- ◆ talk by Georg Frenz in TG11 session
