

# Commissioning of GERDA

J. Janicskó-Csáthy for the GERDA  
collaboration

# $0\nu 2\beta$ decay

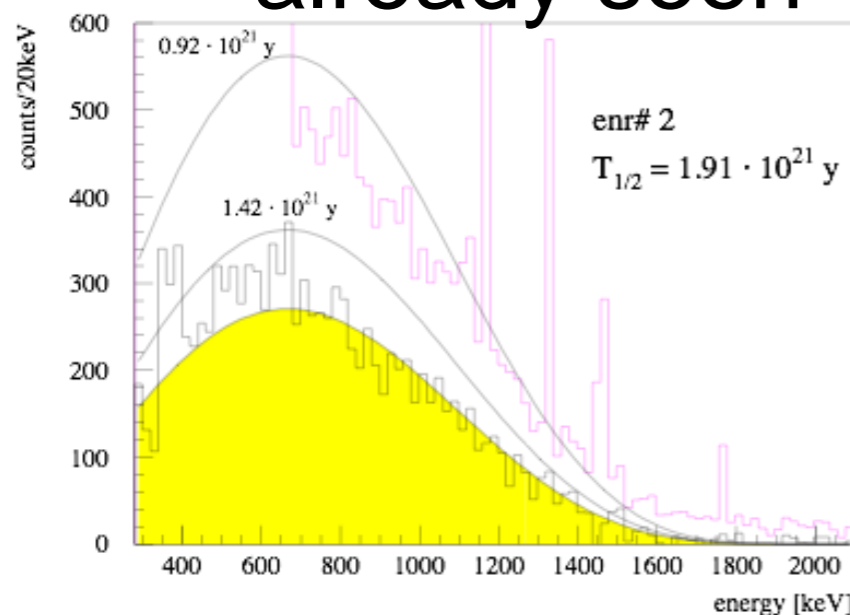

$2\beta$  decay with 2 neutrinos

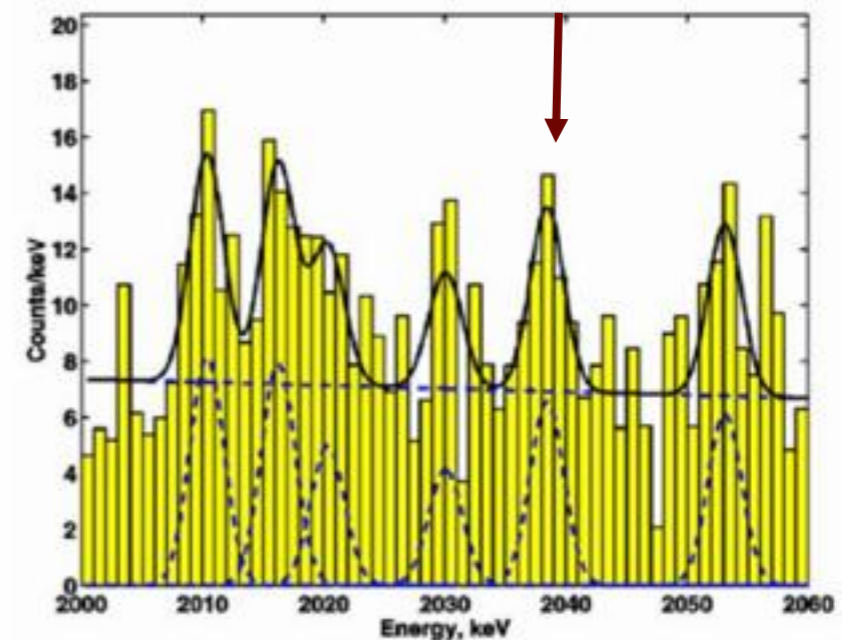

$2\beta$  decay with 0 neutrinos

$2\nu 2\beta$  decay in  $^{76}\text{Ge}$  was already seen

Phys. Rev. D 55 (1997) 54

Claim:  $T_{1/2} = 1.2 \cdot 10^{25} \text{ y}$

Phys.Lett. B 586 (2004) 198

# GERDA

- GERDA is built to test the Claim
- Phase I: HM and IGEX detectors will be redeployed. total mass 17.66 kg with a projected background level of  $10^{-2}$  cts/(keV kg y)
- Phase II: 36.6 kg enriched  $^{76}\text{Ge}$  is available for detector production. Projected background level  $10^{-3}$  cts/(keV kg y)
- Phase III: 1 tone experiment?

Claim

- about 100 members
- 19 institutions from 6 countries

# GERDA at Gran Sasso

Located at Gran Sasso (LNGS)  
Hall A , 3400 m w.e.

# GERDA Milestones

Cryostat delivered March 2008

Water tank completed May 2008

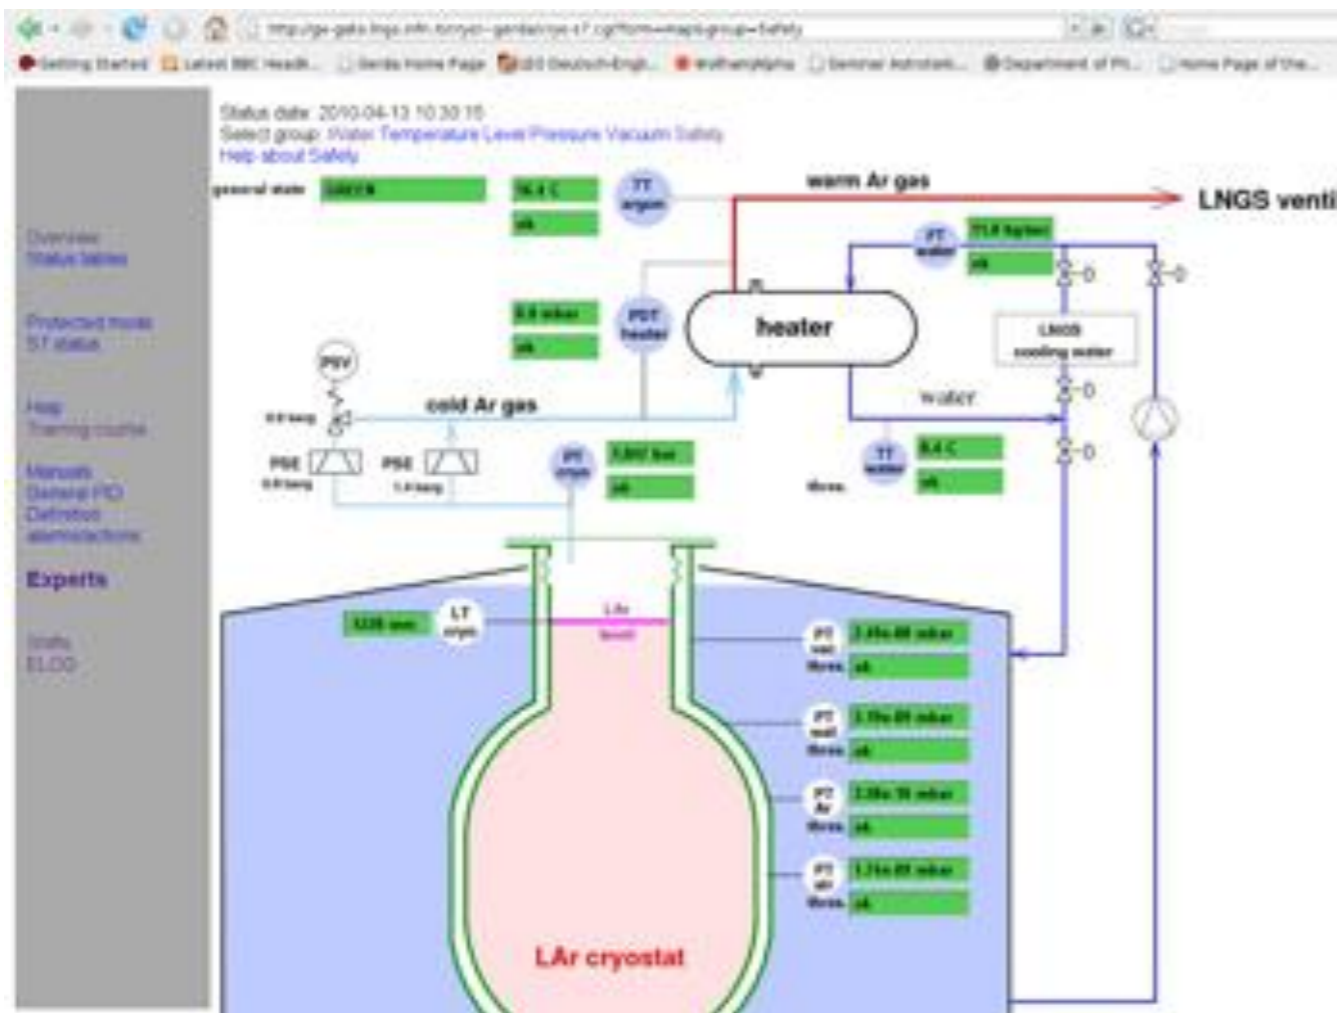

2009 April Clean Room built up

2009 construction completed:  
In Nov. 2009 started filling with LAr

# Cryogenic Infrastructure

- LAr level stable, no evaporation losses: active cooling with LN
- Slow control with web interface
- Operating since 2009, Nov

Cooling circuit

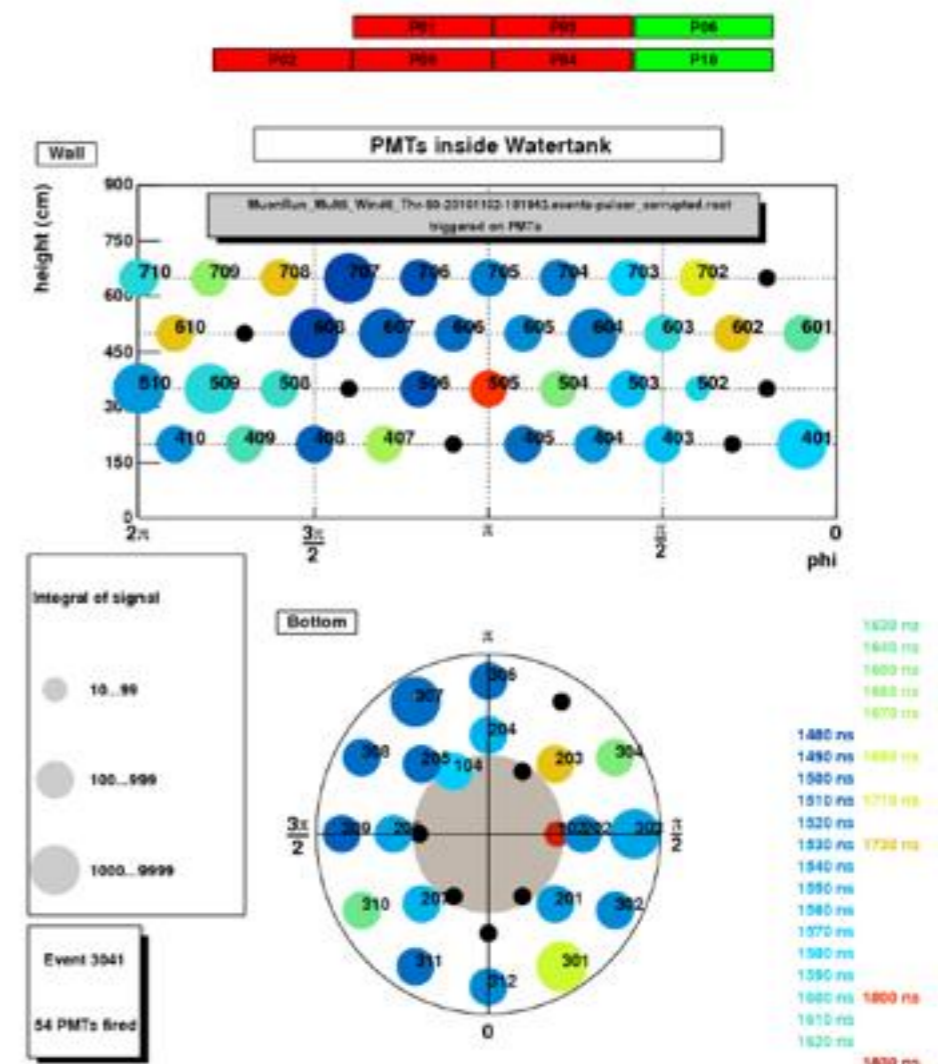

Cu shield

Vacuum insulated steel cryostat

# Muon veto

- 580 t of water instrumented with 66 PMTs
- 4 m<sup>2</sup> plastic scintillator panels on the top
- Completed in 2010, fully functional

See talk T108.4

# Detector handling

- Class 10000 clean room with a class 100 flow box inside for detector handling
- HPGe detectors never come in contact with air:
  - ★ Stored in vacuum
  - ★ Mounted in flow box in N<sub>2</sub>

# Read-out chain

- DAQ with FADCs
- Amplifiers have to be close to the HPGe

★ Cryogenic **low activity** front-end

All up and  
running

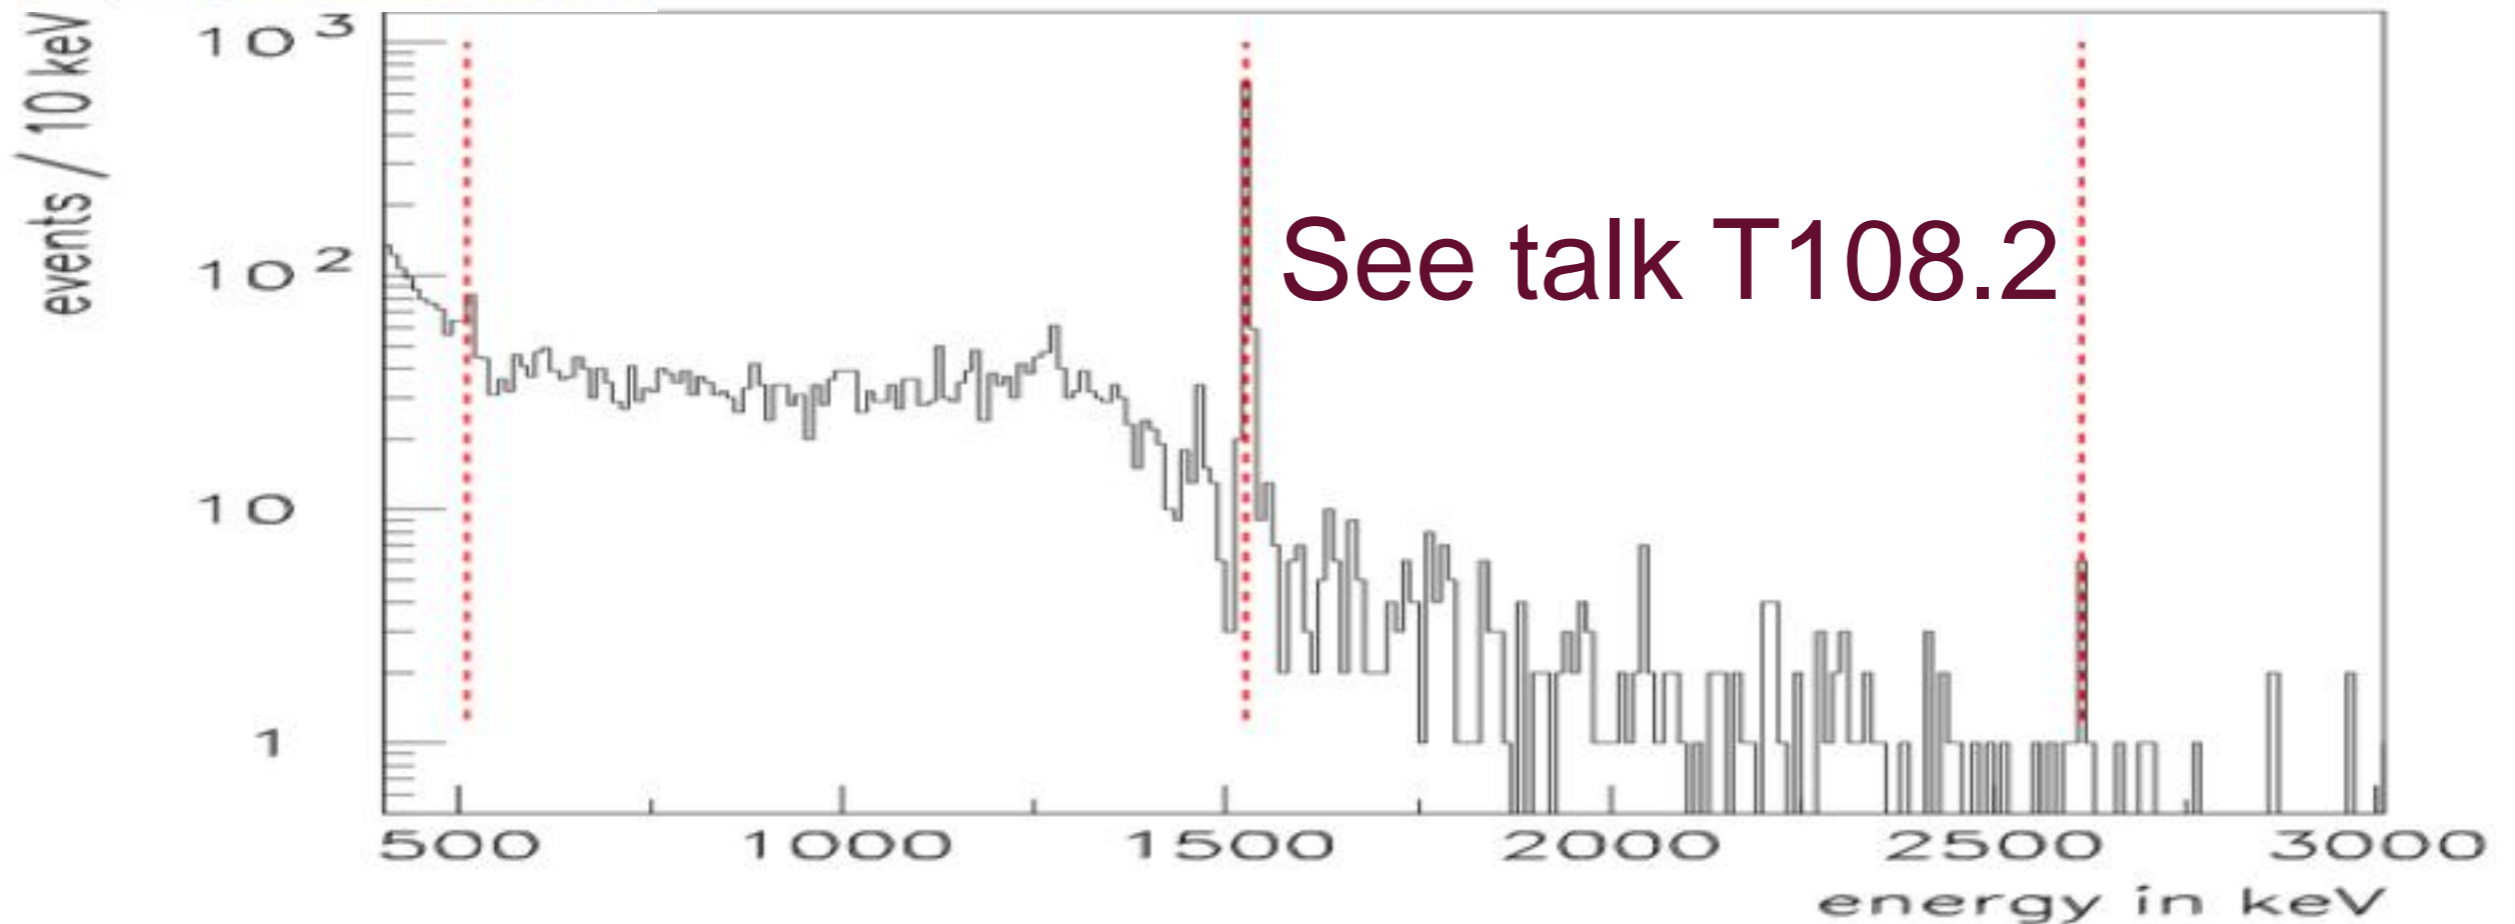

Calibration Spectra  
with  $^{228}\text{Th}$  source

# Commissioning runs

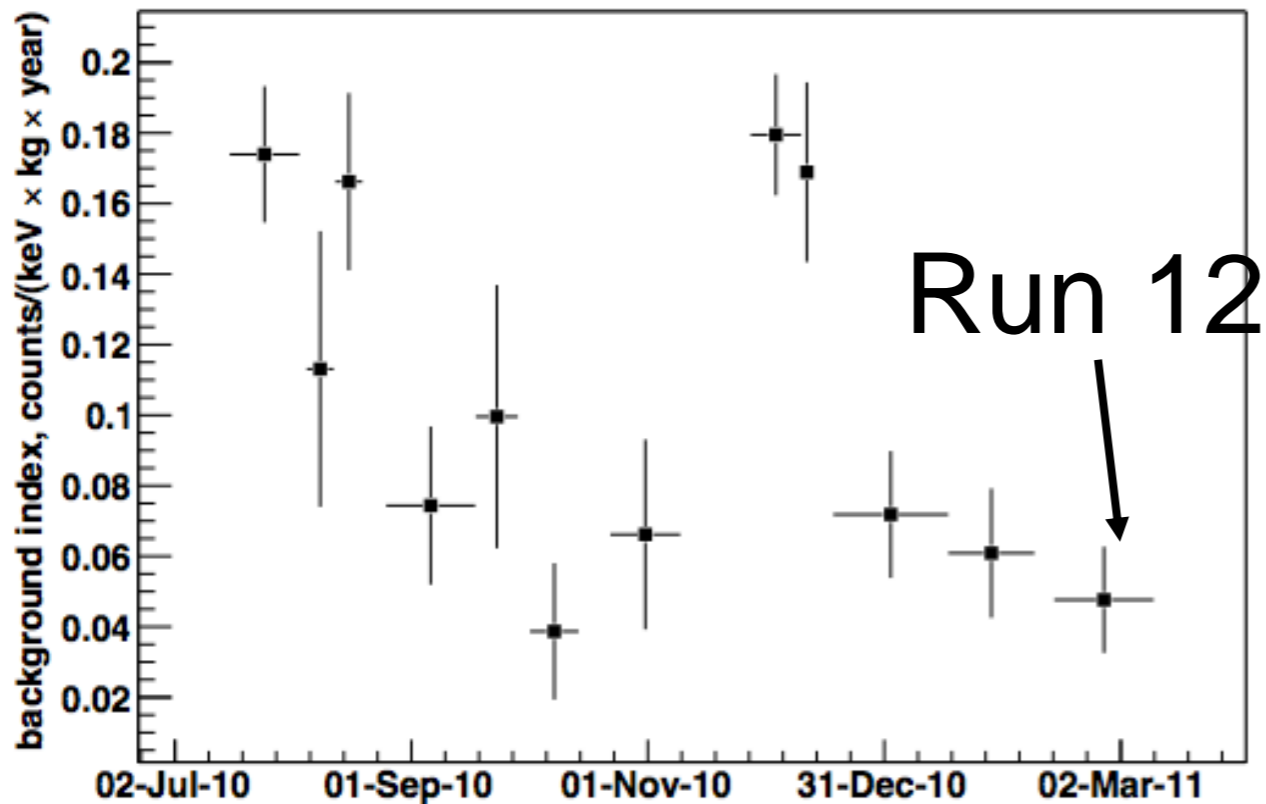

- One string operated with 3 natural Ge detectors
- Taking data since June 2010
- 1.7 kg/y data collected with non-enriched detectors
- Background level already better than in the H-M experiment
- Main background source  $^{42}\text{K}$  /  $^{42}\text{K}$

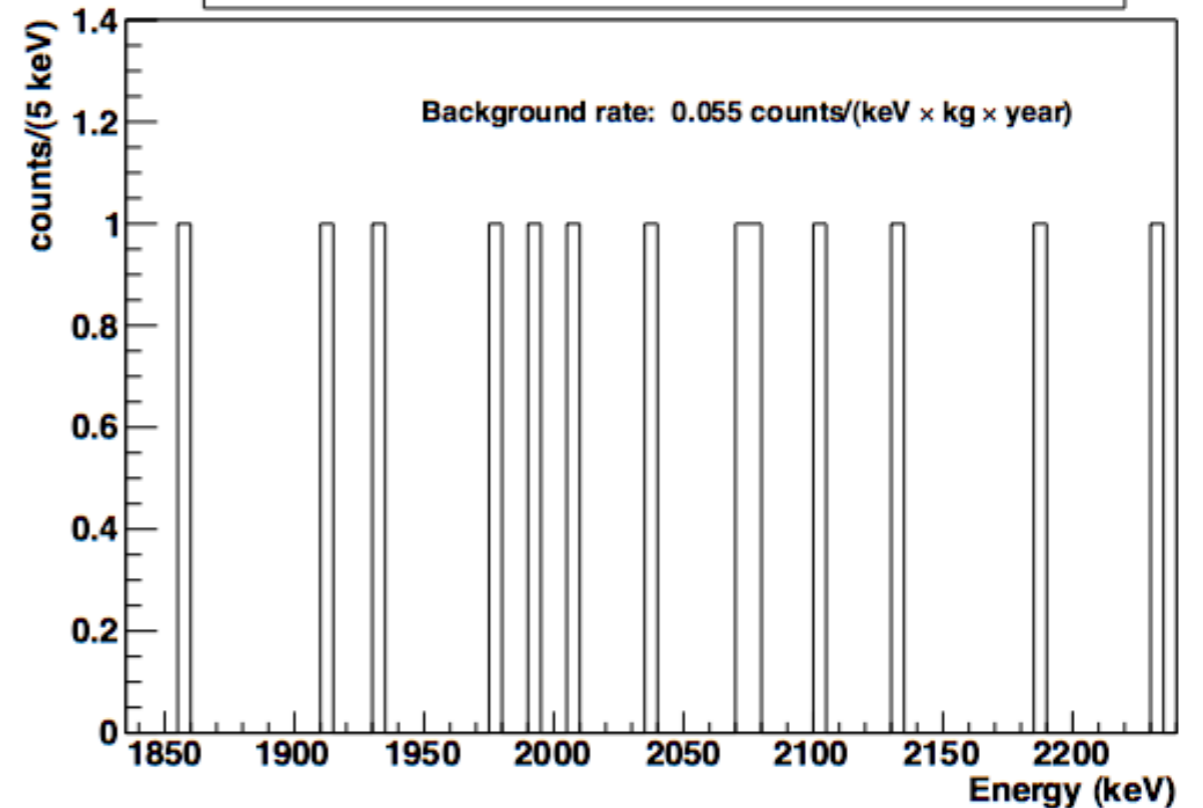

# Commissioning runs

Run history

Run12. Anti-coincidence and mu veto. Exposure: 0.587 kg × year

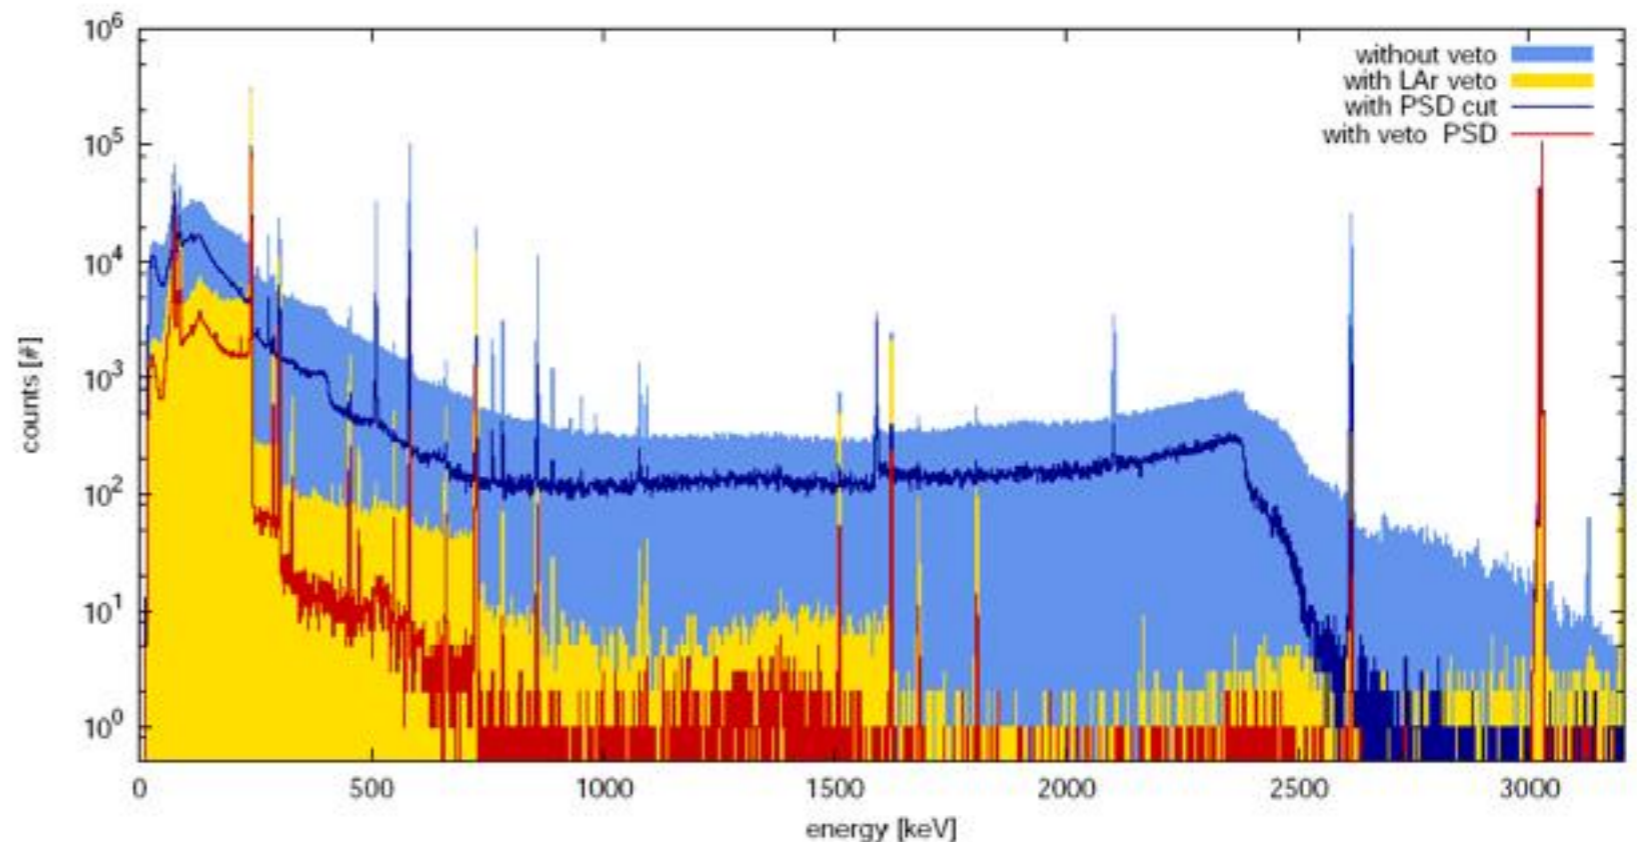

- Background level of 0.055 cts/(keV kg y) reached.
- Commissioning will take some time because we need weeks to see a few hits

# LArGe facility at LNGS

- R&D project for LAr instrumentation
- 1t LAr low background cryostat at LNGS
- LAr scintillation light read out with 9 PMTs
- + low background HPGe detectors

Spectacular  
suppression of the  
Compton background  
around 2MeV

# R&D for Phase II

- 53 kg of enriched  $\text{GeO}_2$  reduced and purified
- 36.6 kg Ge metal produced out of which 35.4 kg is 6N purity and is available for detector production
- Stored underground in the Rammelsberg mining museum, Goslar

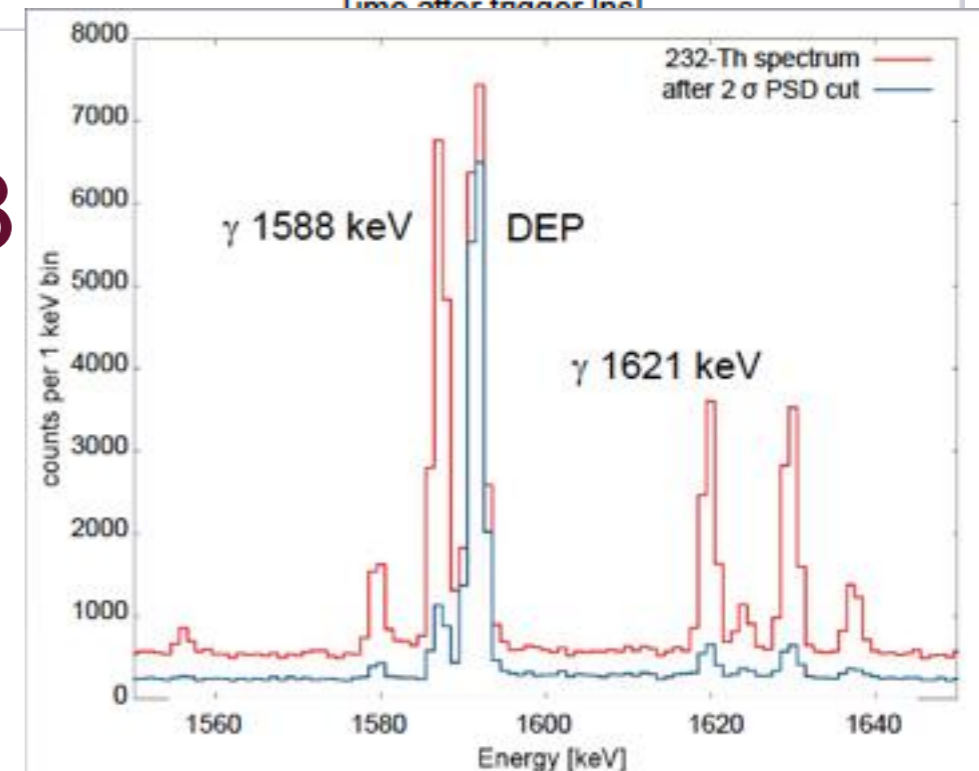

- Cosmogenic  $^{68}\text{Ge}$  and  $^{60}\text{Co}$  two orders of magnitude less than in equilibrium

# R&D for Phase II

- BeGe's are the preferred candidates for Phase II
- Good Pulse Shape Discrimination capabilities and commercially available
- BeGe detectors produced from depleted Ge

See talks T104.5, T108.3

# R&D for Phase II and beyond

- Crystal pulling at Institute für Kristallzüchtung (IKZ) continues
- One crystal with imp. conc.  $4 \times 10^{10} / \text{cm}^3$

- Segmented detector R&D is continuing

See talk T61.7

# Conclusion

- Construction of GERDA is finished
- We are taking data with natural Ge detectors
- Background level already lower than in the H-M experiment
- Enriched detectors will be deployed soon
- The preparation of Phase II is progressing
