# The Cosmological Dark Matter Problem

First indications: velocity of galaxies in a cluster

$$GM = \langle v^2 \rangle r_{1/2} \alpha^{-1}$$

$$\Rightarrow M \gg M_{\text{stars}} + M_{\text{gas}}$$

Zwicky (1933):  
the “dunkel-materiel”/ the “dark matter”

# Sterile Neutrinos as Dark Matter: History

- “Super-weak” neutrinos ( $G < G_F$ ) [Olive & Turner, 1982]: Earlier Decoupling, abundance set by standard dark matter production mechanism of decoupling temperature and degrees of freedom disappearance
- “Sterile” neutrinos [Dodelson & Widrow, 1993]: No SM interactions beyond mass terms, inclusion of finite-temperature modifications to self-energy, lack of thermalization. WDM.
- “Resonant” sterile neutrinos [Shi & Fuller, 1999]: Finite temperature production with non-zero lepton number resonant enhanced production. WDM to CDM. “Cool” Dark Matter.
- “Precision” Sterile Neutrino Dark Matter & Proposal for X-ray Detection [Abazajian, Fuller & Patel 2001; KA 2005]: Full momentum-space production description with QCD transition corrections, resonant to non-resonant solutions as a continuum in lepton number.

# Sterile Neutrinos

## Beyond the Standard Model of Particle Physics

- $\nu_s$  Phenomenological Insertion of Majorana & Dirac Mass Terms of Comparable Magnitude (atmos. & solar) (e.g.  $\nu$ MSM Asaka et al 2006)
- $\nu_s$  Left-Right Symmetric Models (Pati & Salam 1974; Mohapatra & Pati 1975)
- $\nu_s$  Higher Dimensional Operators in String-Inspired models (Langacker 1998)
- $\nu_s$  Bulk Fermions in Large Extra Dimensions (ADD; Dvali & Smirnov 2000)
- $\nu_s$  Axino in R-parity Violating Minimal Supersymmetric Models (Chun & Kim 1999)

# The $\nu$ MSM: a minimalist model

- “Neutrino Minimal Standard Model of Particle Physics”
- Model stipulates that short-baseline anomalies have nothing to do with neutrino oscillations
- Basically the minimal “mini see-saw” mechanism

$$\delta\mathcal{L} = \bar{N}_I i\partial_\mu \gamma^\mu N_I - f_{I\alpha}^\nu \Phi \bar{N}_I L_\alpha - \frac{M_I}{2} \bar{N}_I^c N_I + h.c.$$

- Two heavy  $\gtrsim 100$  GeV sterile neutrinos provide atmospheric & solar mass scales, leptogenesis; **no room for LSND**
- Light sterile neutrino is the Dark Matter [Asaka, Blanchet & Shaposhnikov 2005]
- More involved models generally involve similar insertions for neutrino mass generation

# Sterile $\nu$ WDM Radiative Decay in the X-ray

**Decay:** Shrock 1974; Pal & Wolfenstein 1981  
**X-ray:** Abazajian, Fuller & Tucker 2001

$$“\nu_s” \rightarrow “\nu_\alpha” + \gamma$$

$$E_\gamma = \frac{m_s}{2} \sim 1 \text{ keV}$$

$$\Gamma_\gamma = 1.62 \times 10^{-28} \text{ s}^{-1} \left( \frac{\sin^2 2\theta}{7 \times 10^{-11}} \right) \left( \frac{m_s}{7 \text{ keV}} \right)^5$$

# Dwarf galaxies suggest dark matter theory may be wrong

**By Leila Battison**

Science reporter, Bradford

Dwarf galaxies around the Milky Way are less dense than they should be if they held cold dark matter

**Scientists' predictions about the mysterious dark matter purported to make up most of the mass of the Universe may have to be revised.**

Research on dwarf galaxies suggests they cannot form in the way they do if dark matter exists in the form that the most common model requires it to.

That may mean that the Large Hadron Collider will not be able to spot it.

Leading cosmologist Carlos Frenk spoke of the "disturbing" developments

[Martoff, Napolitano, Hudson, Wang, Smith, Renshaw, Fuller, E Grohs]

High precision time of flight measurements needed to achieve  $6\sigma$  separation from zero mass peak

Recent studies show this may now be feasible

# Summary

- An unidentified line has been detected at  $4\sigma$  to  $5\sigma$  in two independent samples of stacked X-ray clusters with XMM-Newton, with several subsamples showing the line. It is seen by the same group in the Perseus Cluster with Chandra data. (Bulbul et al. ApJ 2014)
- Within a week, an independent group reported a line at the same energy toward Andromeda (M31) and Perseus with *XMM-Newton*, with combined statistical evidence of  $4.4\sigma$ . (Boyarsky et al. PRL 2014).
- Seen in 8 more clusters at lower significance. No consistent astrophysical interpretation exists.
- Follow up observations:
  - current: Hitomi (data implications uncertain)
  - 2017-2018: Micro-X, XQC
  - 2028+: ATHENA
- The simplest model for the signal is resonant **sterile neutrino production** with a cosmological  $L$ . The signal crosses a transition region from “cold” dark matter to “warm” dark matter, particularly at a small-scale structure cutoff scale of great interest in galaxy formation of the local group of galaxies,  $\sim 2$  keV thermal WDM.
