	$-ie \gamma_\mu$	$\frac{1}{q^2}$

U.Uwer

SM Precision Tests

$$\frac{-i(g_{\mu\nu} - q_\mu q_\nu / M^2)}{q^2 - M^2}$$

$$\sin^2 \theta_w = 1 - \frac{M_w^2}{M_Z^2}$$

Standard Model

$$g_V = T_3 - 2Q \sin^2 \theta_w \quad \text{and} \quad g_A = T_3$$

$$g_L = \frac{1}{2}(g_V + g_A) \quad g_R = \frac{1}{2}(g_V - g_A)$$

$$\frac{g_V}{g_A} = 1 - 2 \frac{Q}{T_3} \sin^2 \theta_w = 1 - 4|Q| \sin^2 \theta_w$$

	g_V	g_A
ν	$\frac{1}{2}$	$\frac{1}{2}$
ℓ^-	$-\frac{1}{2} + 2 \sin^2 \theta_w$	$-\frac{1}{2}$
u -quark	$+\frac{1}{2} - \frac{4}{3} \sin^2 \theta_w$	$\frac{1}{2}$
d -quark	$-\frac{1}{2} + \frac{2}{3} \sin^2 \theta_w$	$-\frac{1}{2}$

LEP1 + SLC Cross Section

$$|A|^2 = \left| \begin{array}{c} \text{Diagram 1} \\ \text{Diagram 2} \end{array} \right|^2$$

for $e^+ e^- \rightarrow \mu^+ \mu^-$

Matrix elements:

$$A_\gamma = -ie^2 (\bar{u}_\mu \gamma^\nu v_\mu) \frac{g_{\rho\nu}}{q^2} (\bar{v}_e \gamma^\rho u_e)$$

$$A_Z = -i \frac{g^2}{\cos^2 \theta_W} \left[\bar{u}_\mu \gamma^\nu \frac{1}{2} (g_V^\mu - g_A^\mu \gamma^5) v_\mu \right] \underbrace{\frac{g_{\rho\nu} - q_\rho q_\nu / M_Z^2}{(q^2 - M_Z^2) + iM_Z \Gamma_Z}}_{\text{Z propagator considering a finite Z width (real particle)}} \left[\bar{v}_e \gamma^\rho \frac{1}{2} (g_V^e - g_A^e \gamma^5) u_e \right]$$

Z propagator considering a
finite Z width (real particle)

LEP1 + SLC Cross Section

One finds for the differential cross section:

$$\frac{d\sigma}{d\cos\theta} = \underbrace{\frac{\pi\alpha^2}{2s}}_{\text{known}} \left[\underbrace{F_\gamma(\cos\theta) + F_{\gamma Z}(\cos\theta)}_{\gamma/Z \text{ interference}} \frac{s(s - M_Z^2)}{(s - M_Z^2)^2 + M_Z^2 \Gamma_Z^2} + \underbrace{F_Z(\cos\theta)}_Z \frac{s^2}{(s - M_Z^2)^2 + M_Z^2 \Gamma_Z^2} \right]$$

Vanishes at $\sqrt{s} \approx M_Z$

$$F_\gamma(\cos\theta) = Q_e^2 Q_\mu^2 (1 + \cos^2\theta) = (1 + \cos^2\theta)$$

$$F_{\gamma Z}(\cos\theta) = \frac{Q_e Q_\mu}{4 \sin^2\theta_W \cos^2\theta_W} [2 g_V^e g_V^\mu (1 + \cos^2\theta) + 4 g_A^e g_A^\mu \cos\theta]$$

$$F_Z(\cos\theta) = \frac{1}{16 \sin^4\theta_W \cos^4\theta_W} [(g_V^e)^2 + (g_A^e)^2] [(g_V^\mu)^2 + (g_A^\mu)^2] (1 + \cos^2\theta) + 8 g_V^e g_A^e g_V^\mu g_A^\mu \cos\theta]$$

Total Cross Section

$$\sigma_Z = \frac{4\pi\alpha^2}{3s} \frac{1}{16\sin^4\theta_W\cos^4\theta_W} [(g_V^e)^2 + (g_A^e)^2](g_V^\mu)^2 + (g_A^\mu)^2] \frac{s^2}{(s - M_Z^2)^2 + (M_Z\Gamma)^2}$$

Breit-Wigner Resonance:
BW description is very general

$$\sigma(s) = 12\pi \frac{\Gamma_e\Gamma_\mu}{M_Z^2} \cdot \frac{s}{(s - M_Z^2)^2 + M_Z^2\Gamma_Z^2}$$

$$\sigma_Z(\sqrt{s} = M_Z) = \frac{12\pi}{M_Z^2} \frac{\Gamma_e\Gamma_\mu}{\Gamma_Z^2}$$

With partial and total widths:

$$\Gamma_f = \frac{\alpha M_Z}{12\sin^2\theta_W\cos^2\theta_W} (g_V^f)^2 + (g_A^f)^2$$

$$\Gamma_Z = \sum_i \Gamma_i \quad BR(Z \rightarrow ii) = \frac{\Gamma_i}{\Gamma_Z}$$

Cross sections and widths
can be calculated within the
Standard Model if all
parameters are known

Large Electron Positron Collider

Year	Centre-of-mass energy range [GeV]	Integrated luminosity [pb^{-1}]
1989	88.2 – 94.2	1.7
1990	88.2 – 94.2	8.6
1991	88.5 – 93.7	18.9
1992	91.3	28.6
1993	89.4, 91.2, 93.0	40.0
1994	91.2	64.5
1995	89.4, 91.3, 93.0	39.8

Measurement of the Z-lineshape

Z Resonance curve:

$$\sigma(s) = 12\pi \frac{\Gamma_e \Gamma_\mu}{M_Z^2} \cdot \frac{s}{(s - M_Z^2)^2 + M_Z^2 \Gamma_Z^2}$$

Peak:
$$\sigma_0 = \frac{12\pi}{M_Z^2} \frac{\Gamma_e \Gamma_\mu}{\Gamma_Z^2}$$

- Resonance position $\rightarrow M_Z$
- Height $\rightarrow \Gamma_e \Gamma_\mu$
- Width $\rightarrow \Gamma_Z$

Initial state Bremsstrahlung corrections

$$\sigma_{ff(\gamma)} = \int_{4m_f^2/s}^1 G(z) \sigma_{ff}^0(zs) dz \quad z = 1 - \frac{2E_\gamma}{\sqrt{s}}$$

Leads to a deformation of the resonance: large (30%) effect !

22

Final State Comparisons

$e^+ e^- \rightarrow \text{hadrons}$

$e^+ e^- \rightarrow \mu^+ \mu^-$

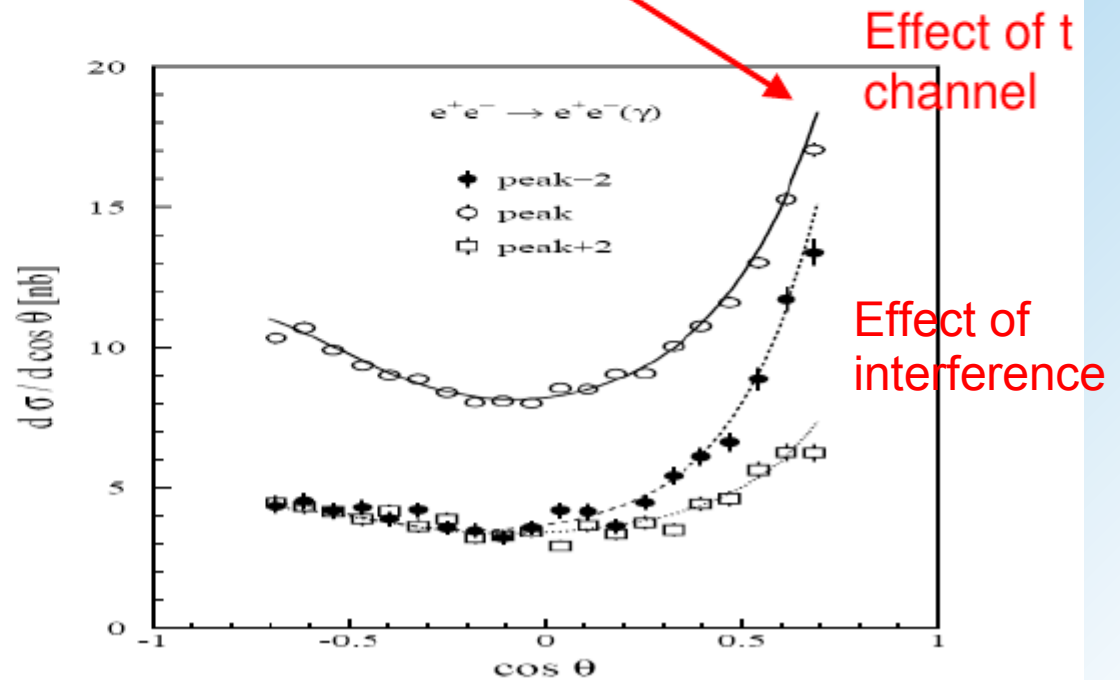

Same resonance shape!

$$e^+ e^- \rightarrow e^+ e^-$$

$$\text{s-channel contribution} \sim (\Gamma_e)^2$$

t channel contribution \rightarrow forward peak

Z Lineshape Parameters LEP (Average)

$$M_Z = 91.1876 \pm 0.0021 \text{ GeV} \quad \pm 23 \text{ ppm} (*)$$

$$\Gamma_Z = 2.4952 \pm 0.0023 \text{ GeV}$$

$$\Gamma_{\text{had}} = 1.7458 \pm 0.0027 \text{ GeV}$$

$$\Gamma_e = 0.08392 \pm 0.00012 \text{ GeV}$$

$$\Gamma_\mu = 0.08399 \pm 0.00018 \text{ GeV}$$

$$\Gamma_\tau = 0.08408 \pm 0.00022 \text{ GeV}$$

$\pm 0.09 \%$

3 leptons are treated independently

test of lepton universality

$$\Gamma_Z = 2.4952 \pm 0.0023 \text{ GeV}$$

$$\Gamma_{\text{had}} = 1.7444 \pm 0.0022 \text{ GeV}$$

$$\Gamma_e = 0.083985 \pm 0.000086 \text{ GeV}$$

Assuming lepton universality: $\Gamma_e = \Gamma_\mu = \Gamma_\tau$
(predicted by SM: g_A and g_V are the same)

*) error of the **LEP energy** determination: $\pm 1.7 \text{ MeV}$ (19 ppm)

<http://lepewwg.web.cern.ch/>

(Summer 2005)

25

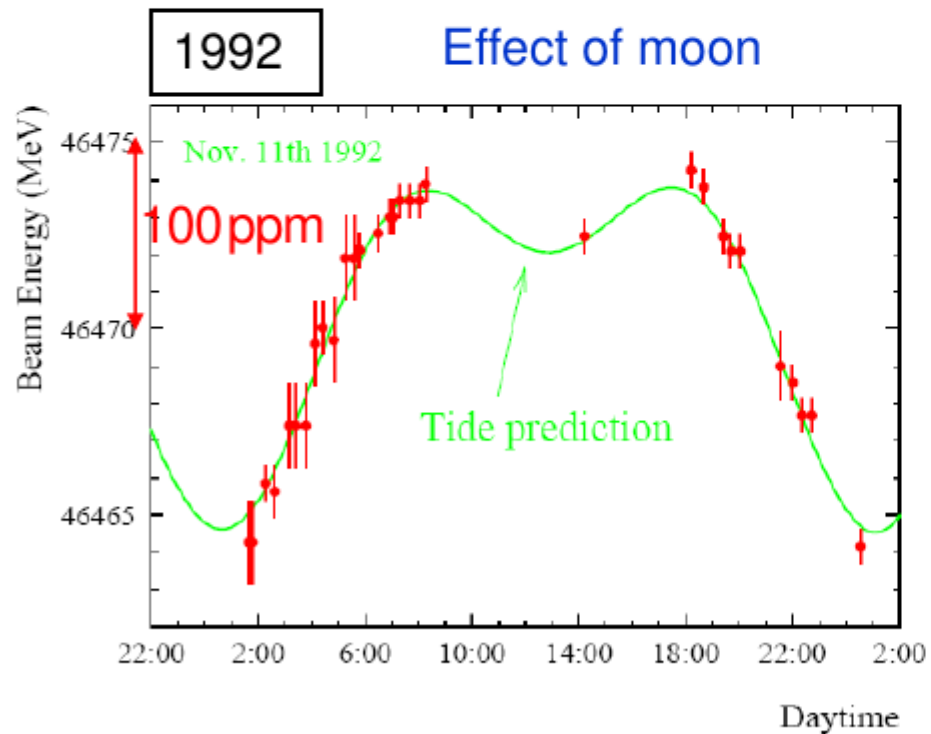

LEP Energy Calibration

Changes of the circumference of the LEP ring changes the energy of the electrons and thus the CM energy (shifts M_Z) :

- tide effects
- water level in lake Geneva

Changes of LEP circumference
 $\Delta C = 1 \dots 2 \text{ mm} / 27 \text{ km}$ ($4 \dots 8 \times 10^{-8}$)

The total strain is 4×10^{-8} ($\Delta C = 1 \text{ mm}$)

TGV (Trains Grand Vitesse) Effect

In conclusion: Measurements at the ppm level are difficult to perform. Many effects must be considered!

Number Light Neutrino Generations

In the Standard Model:

$$\Gamma_Z = \Gamma_{had} + 3 \cdot \Gamma_\ell + \underbrace{N_\nu \cdot \Gamma_\nu}_{\text{invisible} : \Gamma_{inv}} \rightarrow$$

$$\Gamma_{inv} = 0.4990 \pm 0.0015 \text{ GeV}$$

To determine the number of light neutrino generations:

$$N_\nu = \frac{\Gamma_{inv}}{\Gamma_{\nu,SM}} = \underbrace{\left(\frac{\Gamma_{inv}}{\Gamma_\ell} \right)_{exp}}_{5.9431 \pm 0.0163} \cdot \underbrace{\left(\frac{\Gamma_\ell}{\Gamma_\nu} \right)_{SM}}_{=1/1.991 \pm 0.001}$$

(small theo. uncertainties from $m_{top} M_H$)

$$N_\nu = 2.9840 \pm 0.0082$$

No room for new physics: $Z \rightarrow \text{new}$

Heavy Quark production

Identification of b-Quark events:

b-quarks hadronize to b-hadrons (B's, Λ_b) with typical lifetime of ~ 1 ps \rightarrow decay length

Use displaced "2nd" B decay vertex as signature.

Significance = L / error

ratio of Z decays to b

29

Helicity Amplitudes and Asymmetries

J=1

Observables:

$$\sigma_F = \sigma_{LL} + \sigma_{RR}$$

$$\sigma_B = \sigma_{RL} + \sigma_{LR}$$

$$A_{FB} = \frac{\sigma_F - \sigma_B}{\sigma_F + \sigma_B}$$

Forward-backward asym. (final)

$$\sigma_L = \sigma_{LL} + \sigma_{LR}$$

$$\sigma_R = \sigma_{RL} + \sigma_{RR}$$

$$A_{LR} = \frac{\sigma_L - \sigma_R}{\sigma_L + \sigma_R}$$

Left right asym. (initial)

$$\sigma_- = \sigma_{LL} + \sigma_{RL}$$

$$\sigma_+ = \sigma_{RR} + \sigma_{LR}$$

$$\mathcal{P}_f = \frac{\sigma_+ - \sigma_-}{\sigma_+ + \sigma_-}$$

fermion polarization (final)

32

Forward-Backward Asymmetry

$$\frac{d\sigma}{d\cos\theta} \sim (1 + \cos^2\theta) + \frac{8}{3} A_{FB} \cos\theta$$

with $A_{FB} = \frac{\sigma_F - \sigma_B}{\sigma_F + \sigma_B}$

$$\sigma_{F(B)} = \int_{0(-1)}^{1(0)} \frac{d\sigma}{d\cos\theta} d\cos\theta$$

Forward-Backward Asymmetry

Angular distribution:

(see above)

$$F_{\gamma Z}(\cos \theta) = \frac{Q_e Q_\mu}{4 \sin^2 \theta_W \cos^2 \theta_W} \left[2g_V^e g_V^\mu (1 + \cos^2 \theta) + 4g_A^e g_A^\mu \cos \theta \right]$$

$$F_Z(\cos \theta) = \frac{1}{16 \sin^4 \theta_W \cos^4 \theta_W} \left[(g_V^{e2} + g_A^{e2})(g_V^{\mu2} + g_A^{\mu2})(1 + \cos^2 \theta) + 8g_V^e g_A^e g_V^\mu g_A^\mu \cos \theta \right]$$

Forward-backward asymmetry A_{FB}

- Away from the resonance large \rightarrow interference term dominates

$$A_{FB} \sim g_A^e g_A^f \cdot \frac{s(s - M_Z^2)}{(s - M_Z^2)^2 + M_Z^2 \Gamma_Z^2} \rightarrow \text{large}$$

- At the Z pole: Interference = 0 (see energy dependence of interference term)

$$A_{FB} = 3 \cdot \frac{g_V^e g_A^e}{(g_V^e)^2 + (g_A^e)^2} \cdot \frac{g_V^\mu g_A^\mu}{(g_V^\mu)^2 + (g_A^\mu)^2}$$

\rightarrow very small because g_V^l small in SM

Forward-Backward Asymmetry

Asymmetrie at the Z pole

$$A_{FB} \sim g_A^e g_V^e g_A^f g_V^f$$

Cross section at the Z pole

$$\sigma_Z \sim [(g_V^e)^2 + (g_A^e)^2][(g_V^\mu)^2 + (g_A^\mu)^2]$$

Lepton asymmetries together with lepton pair cross sections allow the determination of the lepton couplings g_A and g_V .

Good agreement between the 3 lepton species confirms "lepton universality"

Lowest order SM prediction:

$$g_V = T_3 - 2q \sin^2 \theta_W \quad g_A = T_3$$

Deviation from lowest order SM prediction is an effect of higher-order electroweak corrections.

35

Helicity Amplitudes and Asymmetries

J=1

Observables:

$$\sigma_F = \sigma_{LL} + \sigma_{RR}$$

$$\sigma_B = \sigma_{RL} + \sigma_{LR}$$

$$A_{FB} = \frac{\sigma_F - \sigma_B}{\sigma_F + \sigma_B}$$

Forward-backward asym. (final)

$$\sigma_L = \sigma_{LL} + \sigma_{LR}$$

$$\sigma_R = \sigma_{RL} + \sigma_{RR}$$

$$A_{LR} = \frac{\sigma_L - \sigma_R}{\sigma_L + \sigma_R}$$

Left right asym. (initial)

$$\sigma_- = \sigma_{LL} + \sigma_{RL}$$

$$\sigma_+ = \sigma_{RR} + \sigma_{LR}$$

$$\mathcal{P}_f = \frac{\sigma_+ - \sigma_-}{\sigma_+ + \sigma_-}$$

fermion polarization (final)

Experimental Method to measure tau polarization:

$$\tau^- \rightarrow \pi^- \nu_\tau \quad \text{Spin } 1/2 \rightarrow \text{Spin } 1/2 + \text{Spin } 0$$

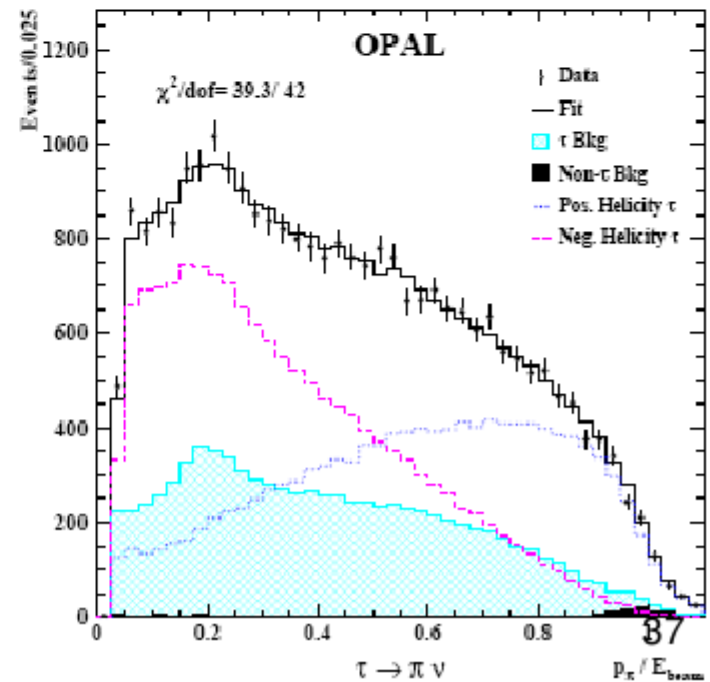

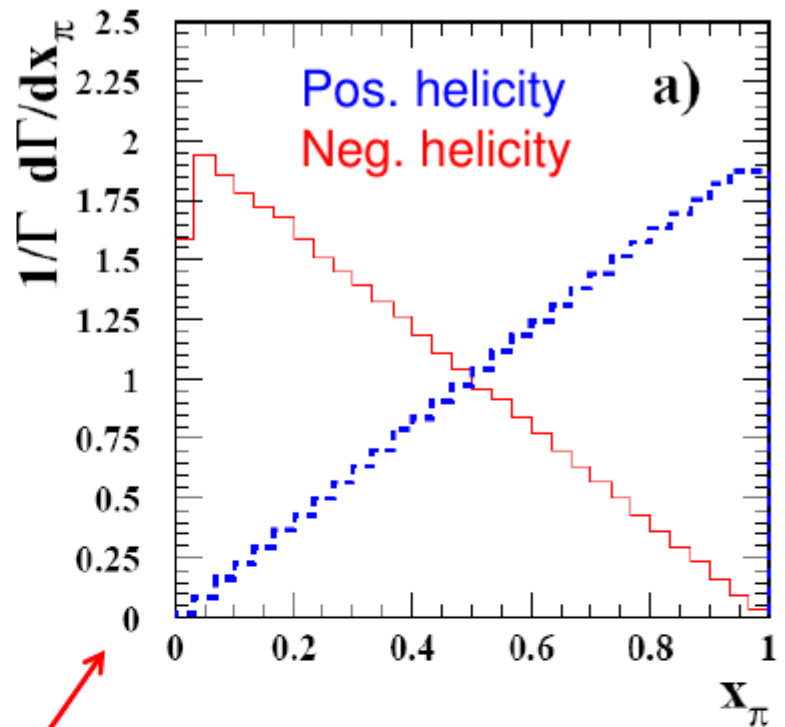

$$\frac{1}{\Gamma} \frac{d\Gamma}{d\cos\theta^*} = \frac{1}{2} (1 + \mathcal{P}_\tau \cos\theta^*)$$

Boost into lab frame

$$\frac{1}{\Gamma} \frac{d\Gamma}{dx_\pi} = 1 + \mathcal{P}_\tau (2x_\pi - 1) \quad x_\pi = E_\pi / E_\tau$$

Fit of the two theoretical distribution to data yields the polarization: ~ 0.15

Result Tau Polarisation

$$\mathcal{A}_\tau = 0.1439 \pm 0.0043$$

$$\mathcal{A}_e = 0.1498 \pm 0.0049$$

$$\mathcal{A}_\ell = 0.1465 \pm 0.0033$$

$$\sin^2 \theta_w^{eff} = 0.23159 \pm 0.00041$$

[hep-ex/0509008](https://arxiv.org/abs/hep-ex/0509008)

Helicity Amplitudes and Asymmetries

J=1

Observables:

$$\sigma_F = \sigma_{LL} + \sigma_{RR}$$

$$\sigma_B = \sigma_{RL} + \sigma_{LR}$$

$$A_{FB} = \frac{\sigma_F - \sigma_B}{\sigma_F + \sigma_B}$$

Forward-backward asym. (final)

$$\sigma_L = \sigma_{LL} + \sigma_{LR}$$

$$\sigma_R = \sigma_{RL} + \sigma_{RR}$$

$$A_{LR} = \frac{\sigma_L - \sigma_R}{\sigma_L + \sigma_R}$$

Left right asym. (initial)

$$\sigma_- = \sigma_{LL} + \sigma_{RL}$$

$$\sigma_+ = \sigma_{RR} + \sigma_{LR}$$

$$\mathcal{P}_f = \frac{\sigma_+ - \sigma_-}{\sigma_+ + \sigma_-}$$

32

Left Right Asymmetry at SLD

Measure cross section σ_L (σ_R) for LH (RH) initial state electrons:

$$A_{LR} = \frac{1}{\mathcal{P}_e} \frac{\sigma_L^f - \sigma_R^f}{\sigma_L^f + \sigma_R^f}$$

Polarization of
electron beam:
 $P \sim 70 - 80\%$

$$A_{LR} = \frac{2g_V^e g_A^e}{(g_V^e)^2 + (g_A^e)^2} = \frac{2(1 - 4 \sin^2 \theta_w)}{1 + (1 - 4 \sin^2 \theta_w)^2}$$

Powerful determination of $\sin^2 \theta_w$.

Requires longitudinal polarization of colliding beams

SLAC Linear Accelerator

Typical beam polarization of 70%.

SLAC Linear Accelerator

Compton Polarimeter

Figure 3.1: A conceptual diagram of the SLD Compton Polarimeter. The laser beam, consisting of 532 nm wavelength 8 ns pulses produced at 17 Hz and a peak power of typically 25 MW, were circularly polarised and transported into collision with the electron beam at a crossing angle of 10 mrad approximately 30 meters from the IP. Following the laser/electron-beam collision, the electrons and Compton-scattered photons, which are strongly boosted along the electron beam direction, continue downstream until analysing bend magnets deflect the Compton-scattered electrons into a transversely-segmented Cherenkov detector. The photons continue undeflected and are detected by a gamma counter (PGC) and a calorimeter (QFC) which are used to cross-check the polarimeter calibration.

SLAC Electron Polarisation

Results Polarisation Asymmetry

Leptonic Final States

SLD

Asymmetry clearly seen for LH and RH cross section.

SLD

All data:

$$A_{LR} = 0.1513 \pm 0.0021$$

$$\sin^2 \theta_w = 0.23098 \pm 0.00026$$

With 0.5×10^6
Z-decays

Results Weinberg Angle

Despite the smaller statistics – SLD beats LEP in precision!

“Running” of Weinberg Angle

→ discussion later

LEP 2

after 1996 the LEP energy was steadily increased up to more than $E_{\text{cms}} = 200 \text{ GeV}$

$W^+ W^-$ Pair Production

$$e^+ e^- \rightarrow WW \rightarrow f\bar{f}f\bar{f}$$

Threshold behavior of the cross section (kinematics, phase space) for $ee \rightarrow WW$ production:

Phase space factor = $f(M_W, \sqrt{s})$:

→ Allows determination of M_W

Electroweak Fit of the W-Boson Mass

Indirect W-Mass Constraints from LEP1

W-mass also enters in virtual radiative corrections:

(February 4, 2008)

The NuTeV collaboration has extracted the electroweak parameter $\sin^2 \theta_W$ from the measurement of the ratios of neutral current to charged current ν and $\bar{\nu}$ cross-sections. Our value, $\sin^2 \theta_W^{(\text{on-shell})} = 0.2277 \pm 0.0013(\text{stat}) \pm 0.0009(\text{syst})$, is **3 standard deviations** above the standard model prediction. We also present a model independent analysis of the same data in terms of neutral-current quark couplings.

$$\text{NuTeV:} \quad \sin^2 \theta_W = 0.2277 \pm 0.0015 \quad (2003)$$

$$\text{SM prediction:} \quad \sin^2 \theta_W = 0.22280 \pm 0.00035 \quad (2004)$$

The SM pull plot

Z-pole parameters

NC Quark Couplings HERA + Tevatron

comparison LEP, Tevatron, HERA

Triple Gauge Couplings

Test of trilinear gauge boson coupling in WW production

Triple gauge coupling an important result of the non-abelian gauge structure.

Most general Lagrangian for VWW:

$$\begin{aligned}
 i\mathcal{L}_{\text{eff}}^{\text{VWW}} / g_{\text{VWW}} &= \boxed{g_1^V} V^\mu (W_{\mu\nu}^- W^{+\nu} - W_{\mu\nu}^+ W^{-\nu}) && \boxed{} = 1, && \Delta\kappa, \Delta g_1 \neq 0 \\
 &+ \boxed{\kappa_V} W_\mu^+ W_\nu^- V^{\mu\nu} + \frac{\lambda_V}{m_W^2} V^{\mu\nu} W_\nu^{+\rho} W_{\rho\mu}^- && \text{all others } 0 && \text{Deviation from SM} \\
 &+ i g_5^V \varepsilon_{\mu\nu\rho\sigma} ((\partial^\rho W^{-\mu}) W^{+\nu} - W^{-\mu} (\partial^\rho W^{+\nu})) V^\sigma \\
 &+ i g_4^V W_\mu^+ W_\nu^- (\partial^\mu V^\nu + \partial^\nu V^\mu) \\
 &- \frac{\tilde{\kappa}_V}{2} W_\mu^- W_\nu^+ \varepsilon^{\mu\nu\rho\sigma} V_{\rho\sigma} - \frac{\tilde{\lambda}_V}{2m_W^2} W_{\rho\mu}^- W_\nu^{+\mu} \varepsilon^{\nu\rho\alpha\beta} V_{\alpha\beta}.
 \end{aligned}$$

Interpretation for γWW

$$q_W = \pm g_V^\gamma \quad \text{charge}$$

$$\mu_W = \frac{e}{2M_W} (1 + \kappa_\gamma + \lambda_\gamma)$$

Dipol moment

Triple Gauge couplings:

Assuming electromagnetic gauge invariance as well as C and P conservation, the number of independent TGCs reduces to five.
Common set: $\{ g_1^Z, \kappa_Z, \kappa_\gamma, \lambda_Z, \lambda_\gamma \}$

Parameters used by the LEP experiments are: $g_1^Z, \kappa_\gamma, \lambda_\gamma$

With additional gauge constraints

$$\begin{aligned} \kappa_Z &= g_1^Z - (\kappa_\gamma - 1) \tan^2 \theta_W \\ \lambda_Z &= \lambda_\gamma, \end{aligned}$$

From a fit to the angular distribution of the WW:

Parameter	68% C.L.	
g_1^Z	$0.984^{+0.022}_{-0.019}$	} =1 in SM
κ_γ	$0.973^{+0.044}_{-0.045}$	
λ_γ	$-0.028^{+0.020}_{-0.021}$	=0 in SM

Standard Model structure of VWW triple boson coupling confirmed.

Top Mass Prediction from Radiative Corrections

$$\text{e.g.: } \Delta r(m_t, M_H) = -\frac{3\alpha \cos^2 \theta_w}{16\pi \sin^4 \theta_w} \frac{m_t^2}{M_W^2} - \frac{11\alpha}{48\pi \sin^2 \theta_w} \ln \frac{M_H^2}{M_W^2} + \dots$$

The measurement of the radiative corrections:

$$\sin^2 \theta_{\text{eff}} \equiv \frac{1}{4} (1 - \bar{g}_V / \bar{g}_A)$$

$$\sin^2 \theta_{\text{eff}} = (1 + \Delta\kappa) \sin^2 \theta_w$$

Allows the indirect determination of the unknown parameters m_t and M_H .

Good agreement between the indirect prediction of m_t and the value obtained in direct measurements confirm the radiative corrections of the SM

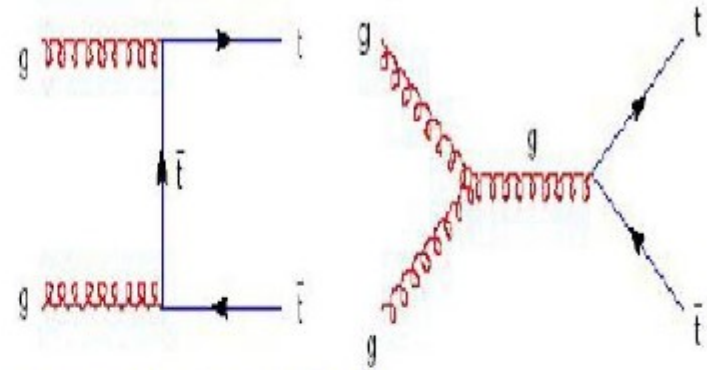

Prediction of m_t by LEP before the discovery of the top at TEVATRON.
