## Exercise 14: *Z*-decay and Majorana fields [15 Points]

The Lagrangian for the coupling of a fermion pair  $f$  with the  $Z$ -boson is

$$\mathcal{L} = \frac{g}{2 \cos \theta_W} \bar{f} \gamma^\mu (v_f - a_f \gamma_5) f Z_\mu,$$

For neutrinos we have that  $v_\nu = a_\nu = \frac{1}{2}$ .

- Calculate the decay width for  $Z \rightarrow \bar{\nu} \nu$ . Keep a possible neutrino mass in the expression.
- Neutrinos could be Majorana particles, which obey the relation  $\nu^c = \nu$ . The superscript  $c$  denotes charge conjugation,

$$\nu^c = C(\bar{\nu})^T,$$

with  $C = i\gamma_2\gamma_0$  in the Dirac basis.

Show the following properties

$$\begin{aligned} -C &= C^T = C^{-1} = C^* = C^\dagger, \\ C^{-1}\gamma_\mu C &= -\gamma_\mu^T, \quad C^{-1}\gamma_5 C = \gamma_5^T, \\ \bar{\psi}^c &= -\psi^T C^{-1}, \quad (\psi_L)^c = (\psi^c)_R. \end{aligned}$$

- Consider two spinor fields  $\psi$  and  $\chi$ . Show that

$$\bar{\psi}_L^c \chi_R^c = \bar{\chi}_L \psi_R,$$

where  $\psi_L^c := (\psi^c)_L = P_L(\psi^c)$  and so on.

- Show that the Lagrangian in the Majorana basis given by

$$\mathcal{L}_{\text{Maj}} = -\frac{1}{2} \begin{bmatrix} \bar{\psi}_L & \bar{\chi}_L \end{bmatrix} \begin{bmatrix} 0 & m \\ m & 0 \end{bmatrix} \begin{bmatrix} \psi_R^c \\ \chi_R^c \end{bmatrix} + \text{h.c.}$$

corresponds to a spinor field with Dirac mass term

$$\mathcal{L}_{\text{Dirac}} = -m\bar{\Psi}\Psi.$$

- Show that for Majorana neutrinos the vector current  $\bar{\nu}\gamma_\mu\nu$  vanishes. What happens with  $\bar{\nu}\gamma_5\nu$ ,  $\bar{\nu}\gamma_\mu\gamma_5\nu$  and  $\bar{\nu}[\gamma_\mu, \gamma_\nu]\nu$ ?
- Using the previous result calculate the decay width  $Z \rightarrow \nu\nu$  for Majorana neutrinos and compare with a).
