$\rho_{\text{crit}} = 1.68829 h^2 \text{ pJ/m}^3$

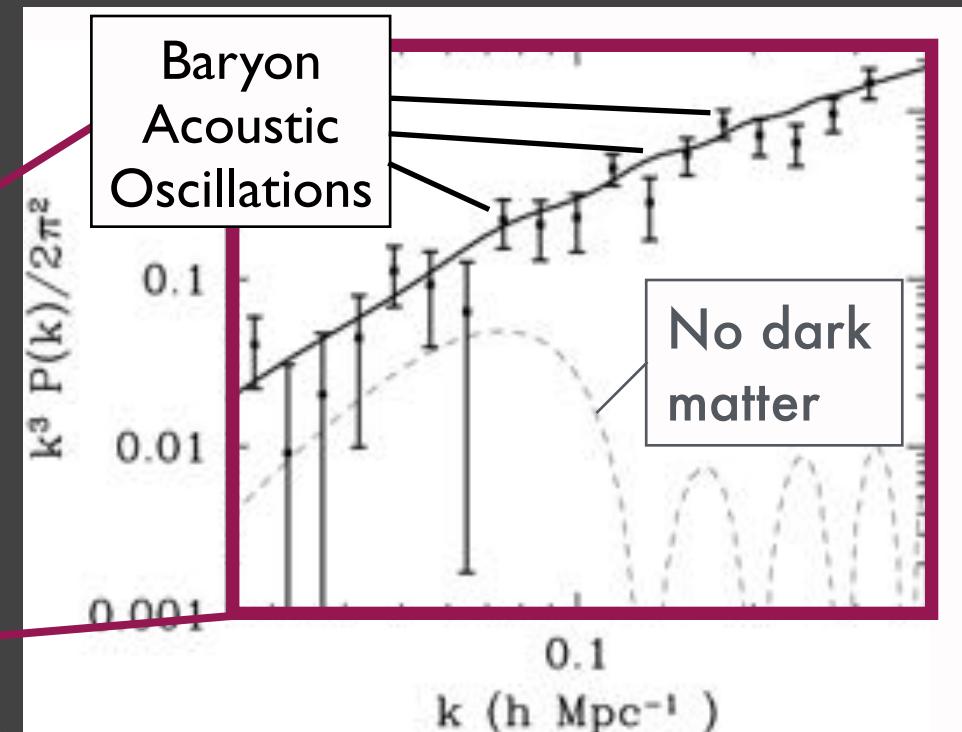

Evidence for *nonbaryonic* cold dark matter

GALAXY FORMATION

Matter fluctuations uncoupled to the plasma can gravitationally grow into galaxies in the given 13 Gyr

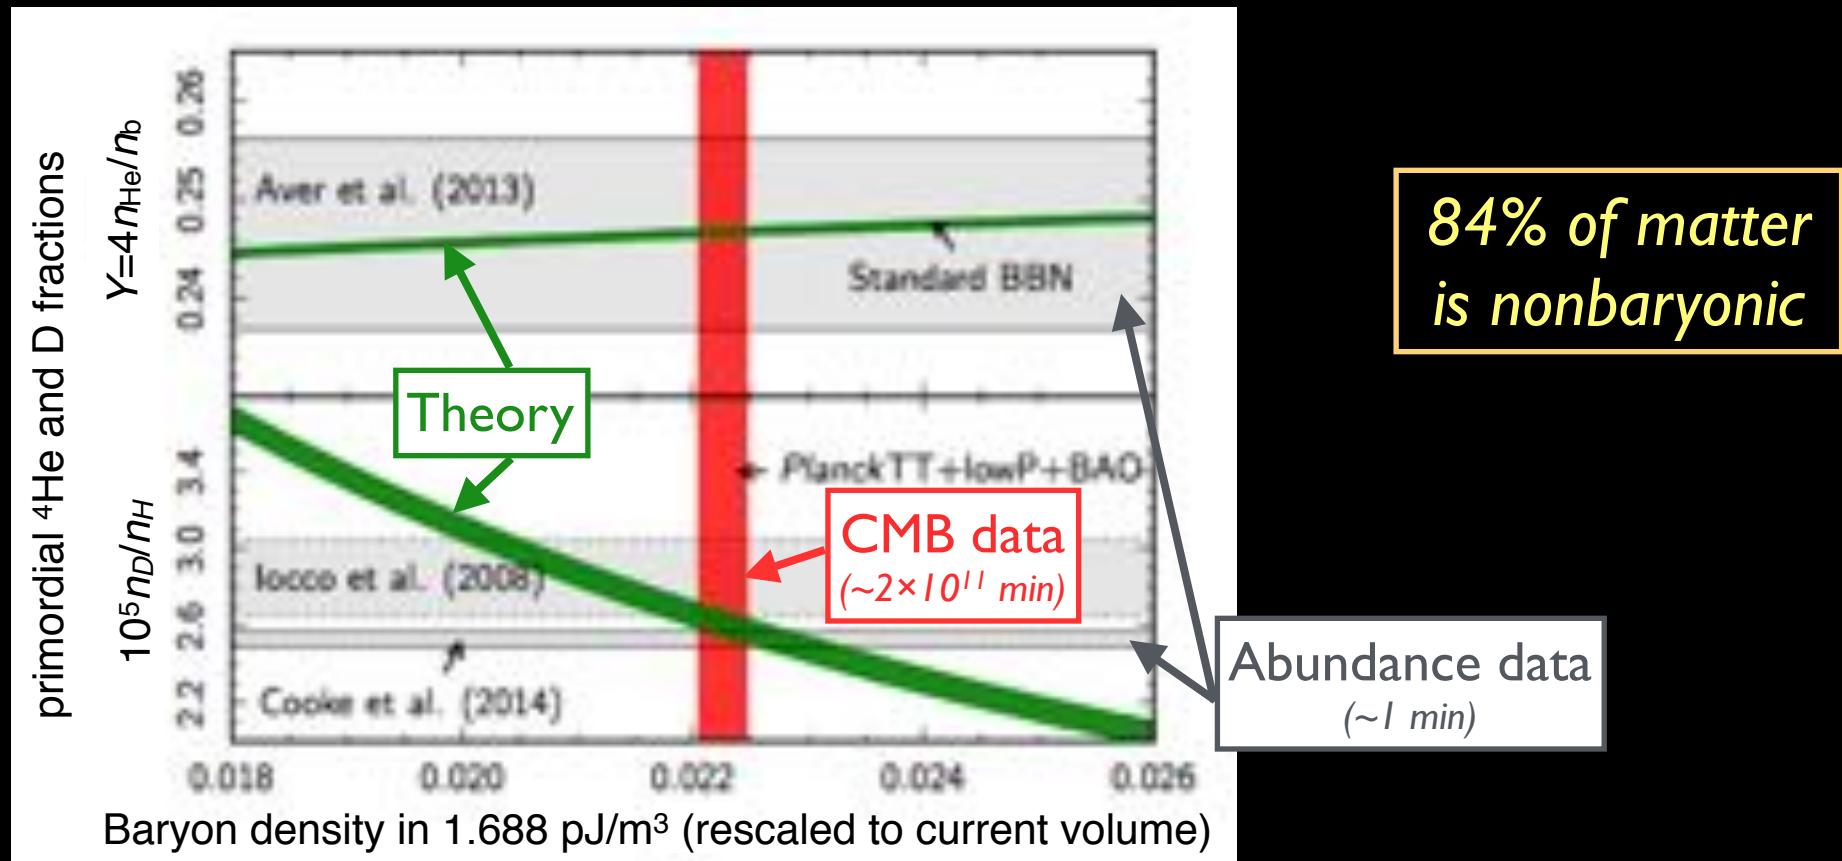

Dark matter is non-baryonic
More than 80% of all matter
does not couple
to the primordial plasma! SDSS

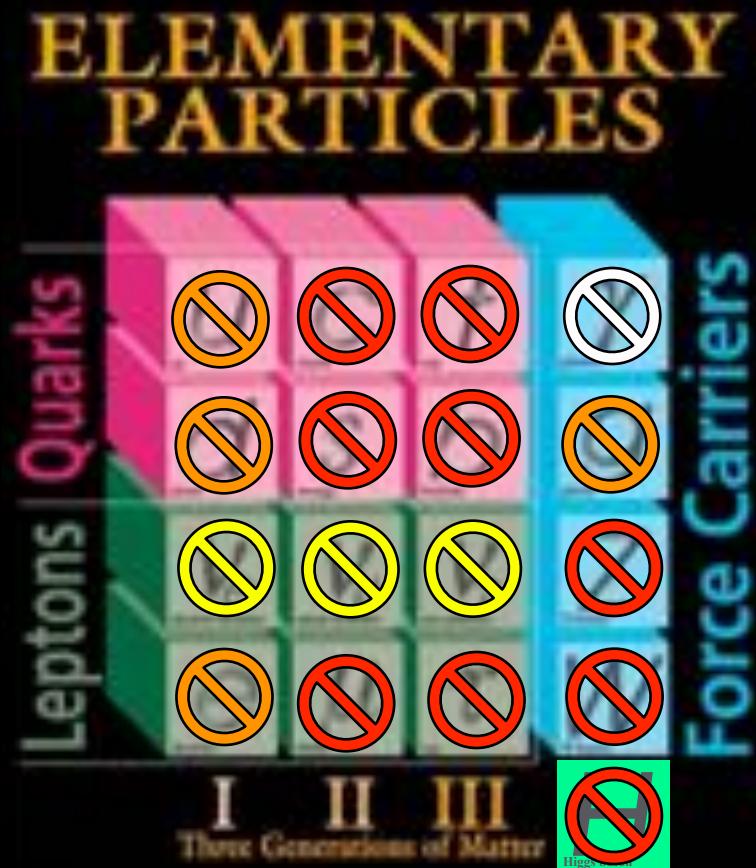

Evidence for *nonbaryonic* cold dark matter

BIG BANG NUCLEOSYNTHESIS

- The baryon-to-photon ratio has been the same since ~ 1 minute after the Big Bang.
- Baryons are $\lesssim 15.7\%$ of the mass in matter.

Is dark matter an elementary particle?

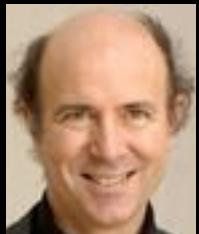

- 🚫 is the particle of light
- 🚫 couples to the plasma
- 🚫 disappears too quickly
- 🚫 is hot dark matter

No known particle can be nonbaryonic cold dark matter!

Physicists have many ideas

Axions

Excited dark matter

Supersymmetric
WIMPs

Dark matter
from extra-
dimensions

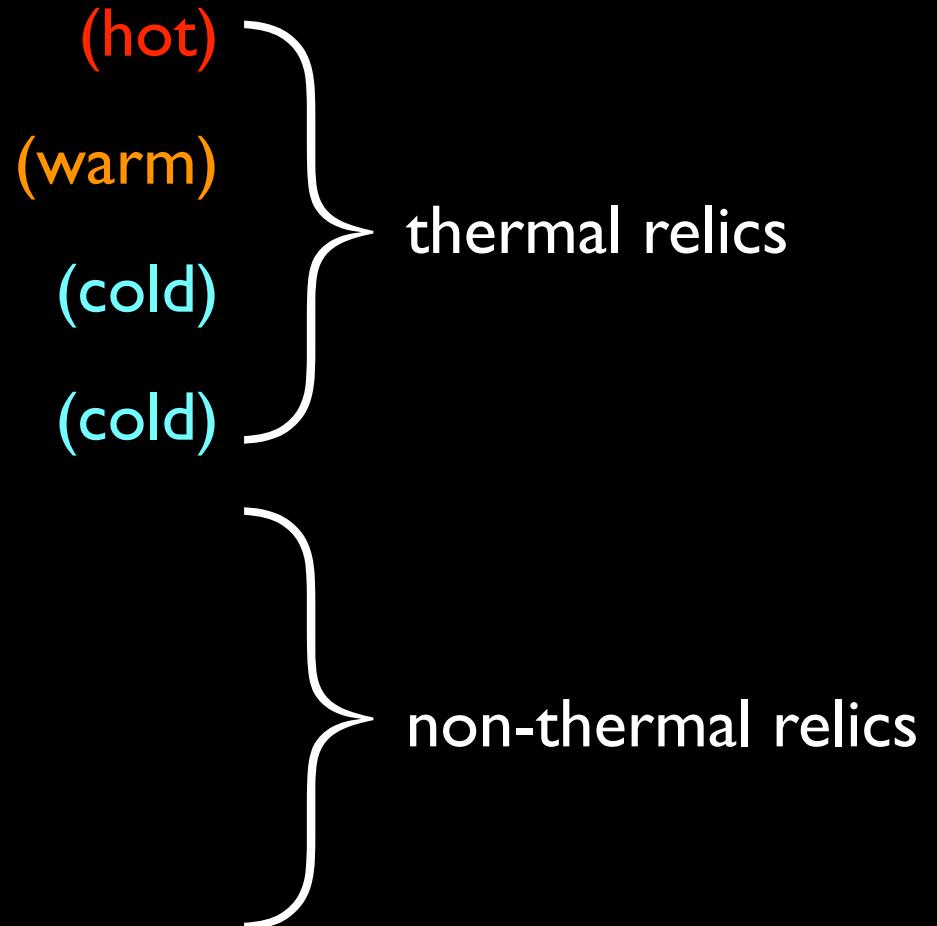

A new force in
the dark sector

Particle dark matter

- neutrinos
- sterile neutrinos, gravitinos
- lightest supersymmetric particle
- lightest Kaluza-Klein particle
- Bose-Einstein condensates, axions, axion clusters
- solitons (Q-balls, B-balls, ...)
- supermassive wimpzillas

Mass range

10^{-22} eV (10^{-56} g) B.E.C.s
 $10^{-8} M_\odot$ (10^{+25} g) axion clusters

Interaction strength range

Only gravitational: wimpzillas
Strongly interacting: B-balls

Particle dark matter

Hot dark matter

- relativistic at kinetic decoupling (start of free streaming)
- big structures form first, then fragment

light neutrinos

Cold dark matter

- non-relativistic at kinetic decoupling
- small structures form first, then merge

neutralinos, axions, WIMPZILLAs, solitons

Warm dark matter

- semi-relativistic at kinetic decoupling
- smallest structures are erased

sterile neutrinos, gravitinos

Particle dark matter

Thermal relics

in thermal equilibrium in the early universe

neutrinos, neutralinos, other WIMPs,

Non-thermal relics

not in thermal equilibrium in the early universe

axions, WIMPZILLAs, solitons,

Axions

Axions as dark matter

Hot

Produced thermally in early universe

Important for $m_a > 0.1 \text{ eV}$ ($f_a < 10^8$), mostly excluded by astrophysics

Cold

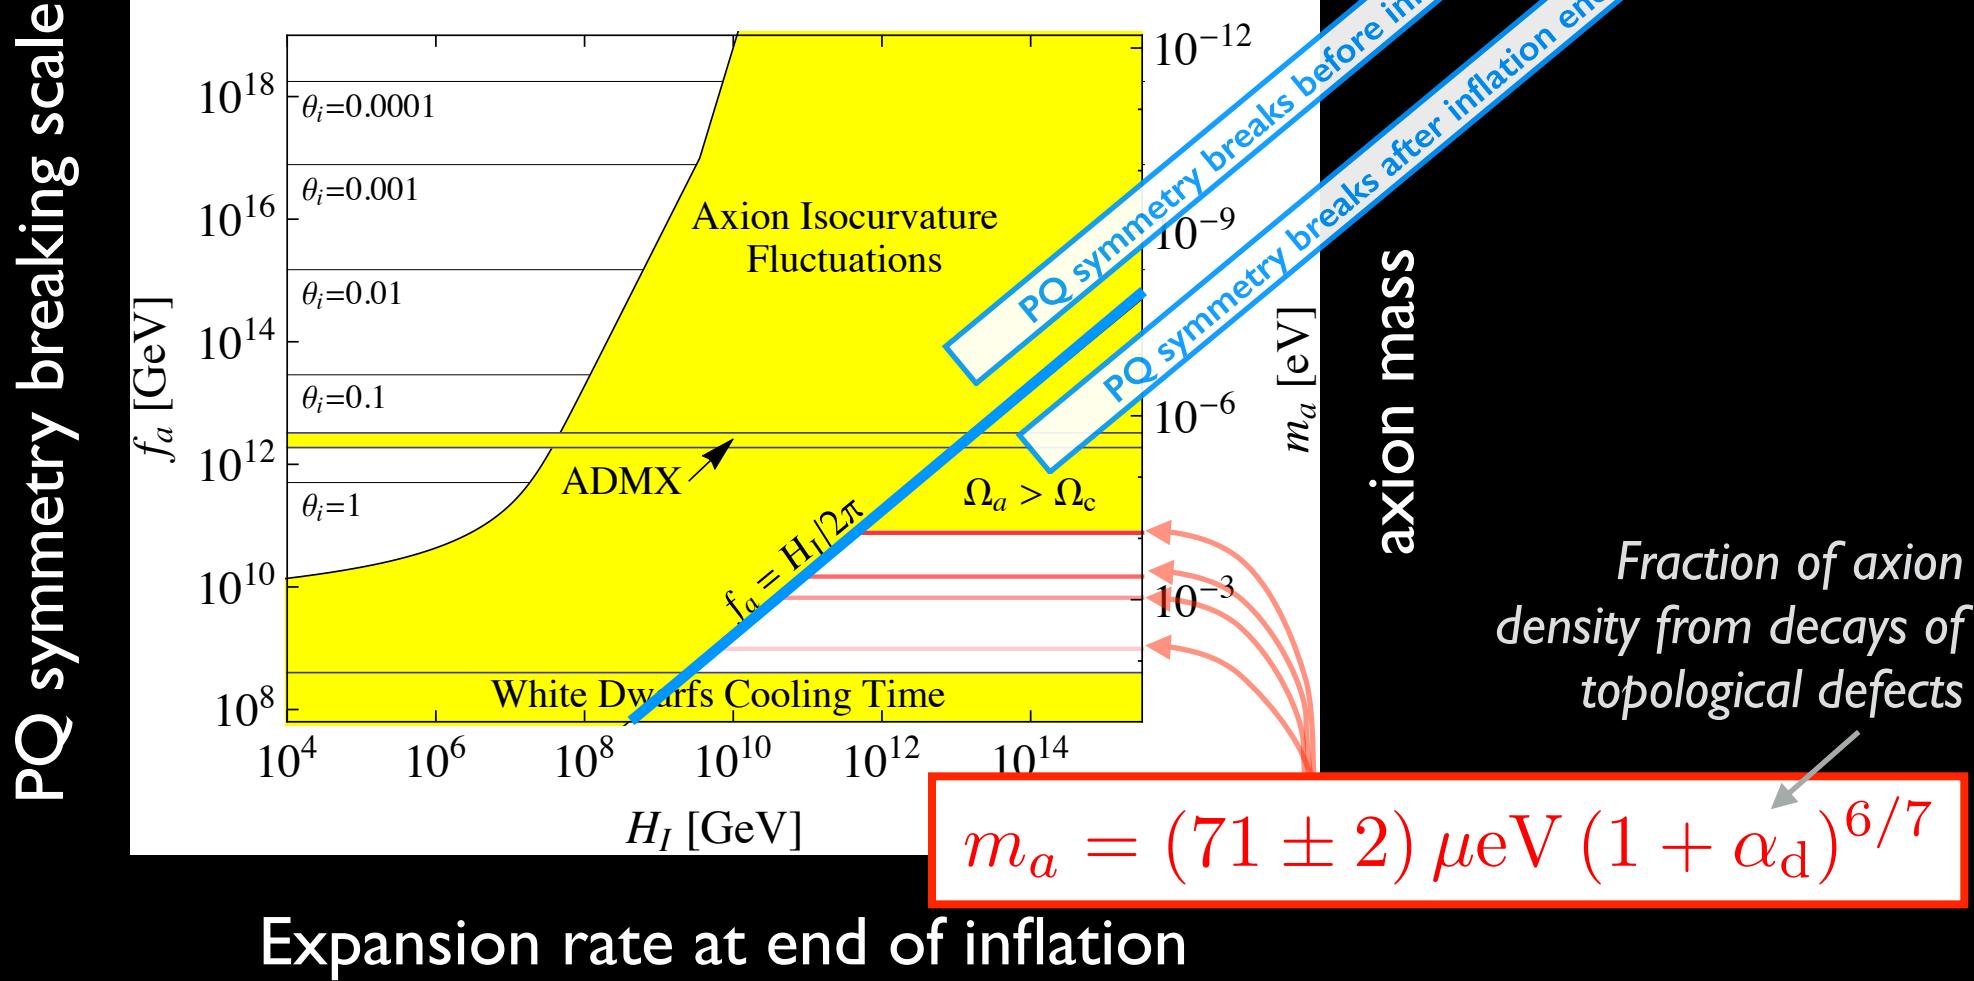

Produced by coherent field oscillations around minimum of $V(\theta)$
(Vacuum realignment)

Produced by decay of topological defects

(Axionic string decays)

Still a very complicated and
uncertain calculation!
e.g. Harimatsu et al 2012

Axion cold dark matter parameter space

Visinelli, Gondolo 2009 + updates

Neutrinos

Heavy active neutrinos

PHYSICAL REVIEW LETTERS

Volume 39

25 JULY 1977

Number 4

Cosmological Lower Bound on Heavy-Neutrino Masses

Benjamin W. Lee¹⁰

Fermil National Accelerator Laboratory,¹⁰ Batavia, Illinois 60510

and

Steven Weinberg¹¹

Stanford University, Physics Department, Stanford, California 94305

(Received 13 May 1977)

The present cosmic mass density of possible stable neutral heavy leptons is estimated in a standard cosmological model. In order for this density not to exceed the upper limit of 3×10^{-23} g/cm³, the lepton mass would have to be greater than a lower bound of the order of 2 GeV.

2 GeV/c² for $\Omega_c=1$

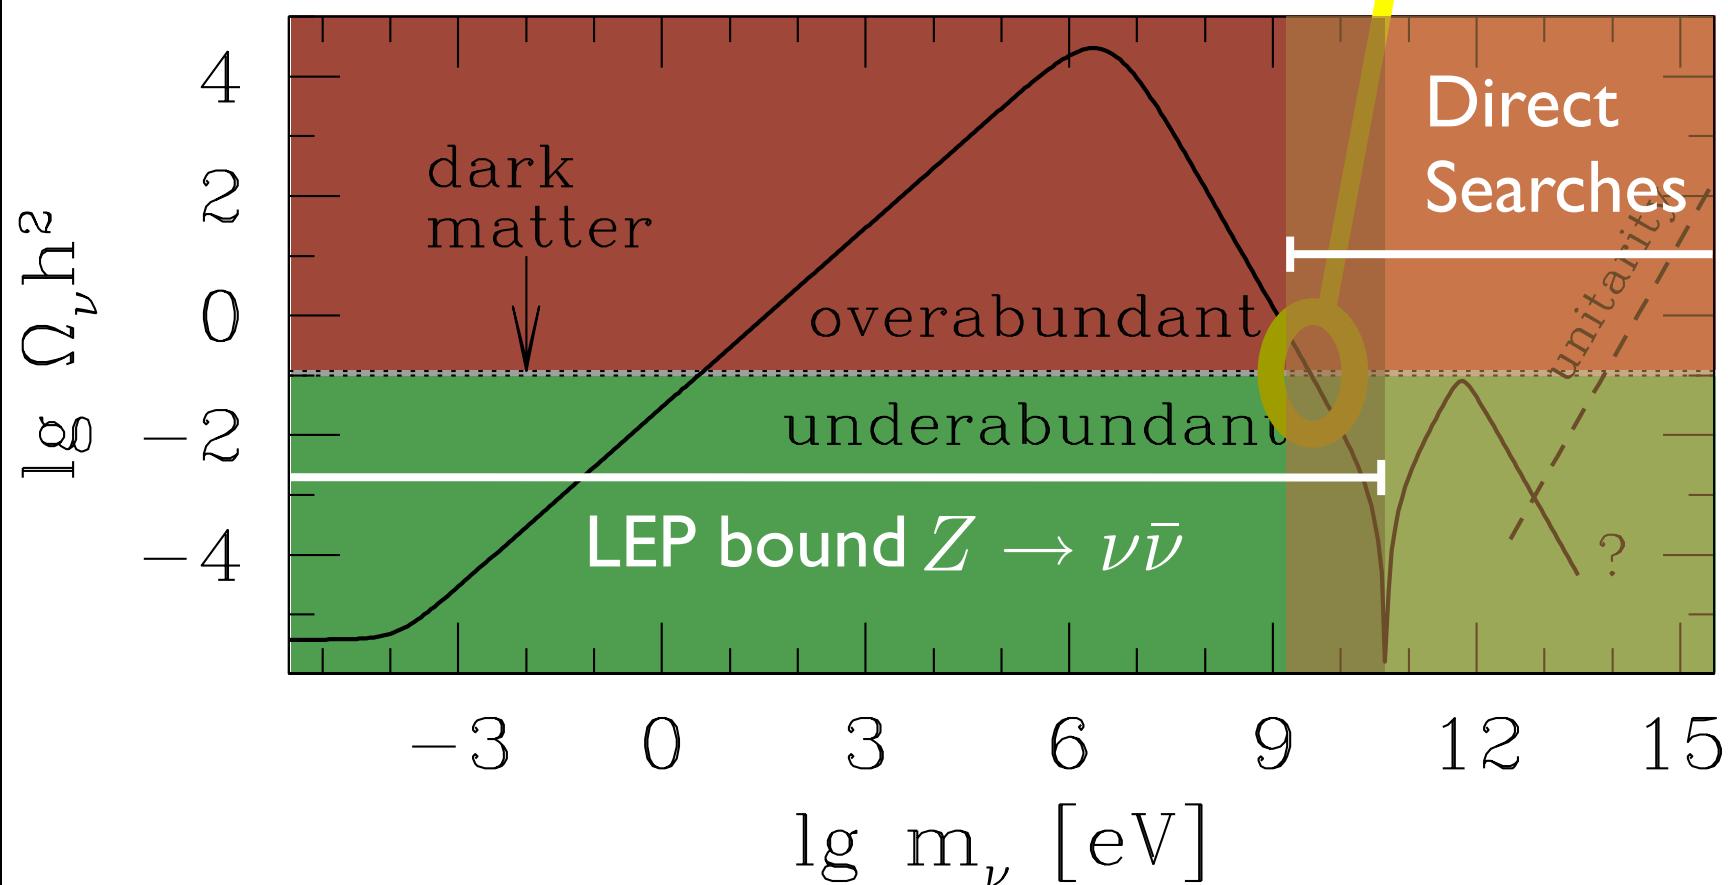

Now 4 GeV/c² for $\Omega_c=0.25$

Cosmic density of massive neutrinos

Fourth-generation Standard Model neutrino

Excluded as dark matter (1991)

~ few GeV
preferred cosmological mass
Lee & Weinberg 1977

Sterile neutrino dark matter

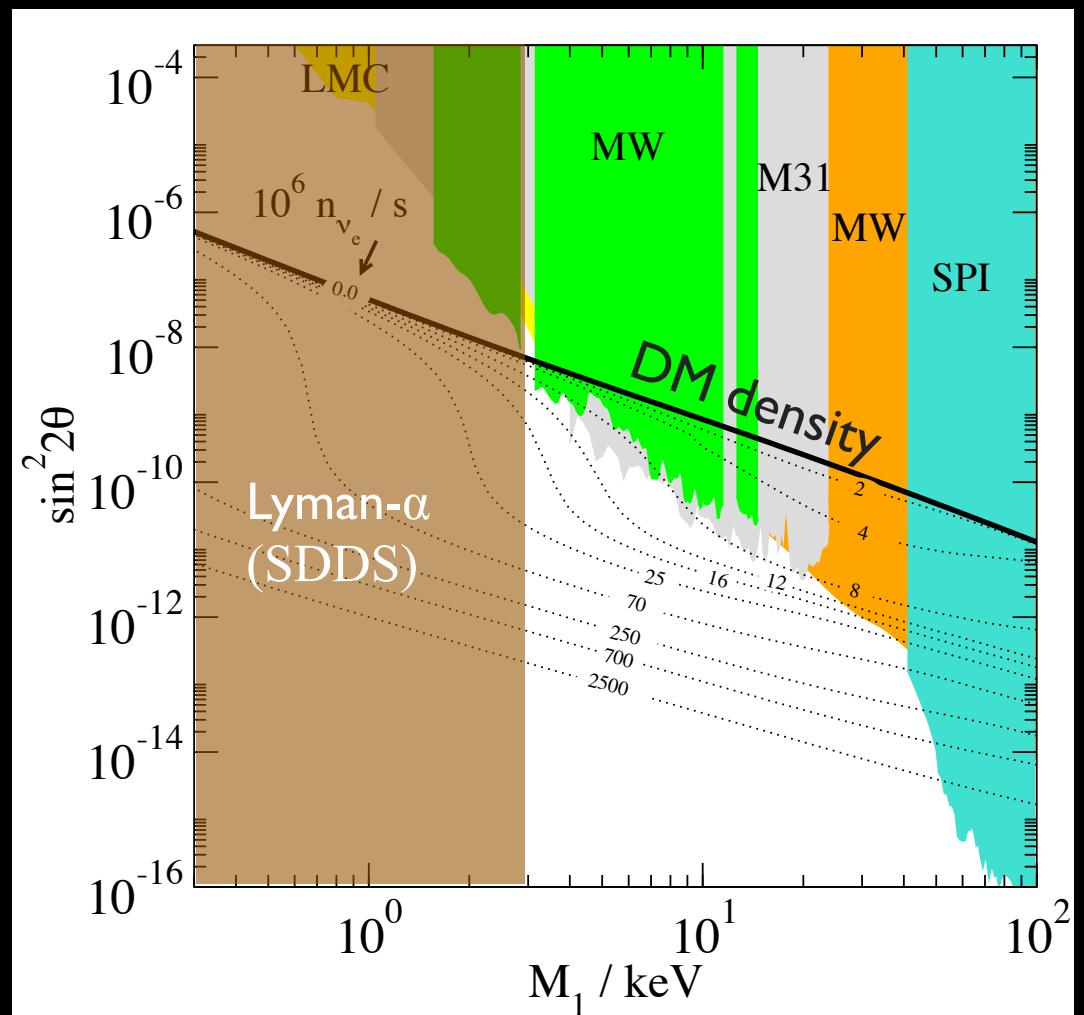

Standard model + right-handed neutrinos

Active and sterile neutrinos oscillate into each other.

Sterile neutrinos can be warm dark matter (mass > 0.3 keV)

Dodelson, Widrow 1994; Shi, Fuller 1999; Laine, Shaposhnikov 2008

ν MSM
Laine, Shaposhnikov 2008

Supersymmetric particles

Supersymmetric dark matter

Neutralinos (the most fashionable/studied WIMP)

Goldberg 1983; Ellis, Hagelin, Nanopoulos, Olive, Srednicki 1984; etc.

Sneutrinos (also WIMPs)

Falk, Olive, Srednicki 1994; Asaka, Ishiwata, Moroi 2006; McDonald 2007; Lee, Matchev, Nasri 2007; Deppisch, Pilaftsis 2008; Cerdeno, Munoz, Seto 2009; Cerdeno, Seto 2009; etc.

Gravitinos (SuperWIMPs)

Feng, Rajaraman, Takayama 2003; Ellis, Olive, Santoso, Spanos 2004; Feng, Su, Takayama, 2004; etc.

Axinos (SuperWIMPs)

Tamvakis, Wyler 1982; Nilles, Raby 1982; Goto, Yamaguchi 1992; Covi, Kim, Kim, Roszkowski 2001; Covi, Roszkowski, Ruiz de Austri, Small 2004; etc.

Neutralino dark matter: impact of LHC

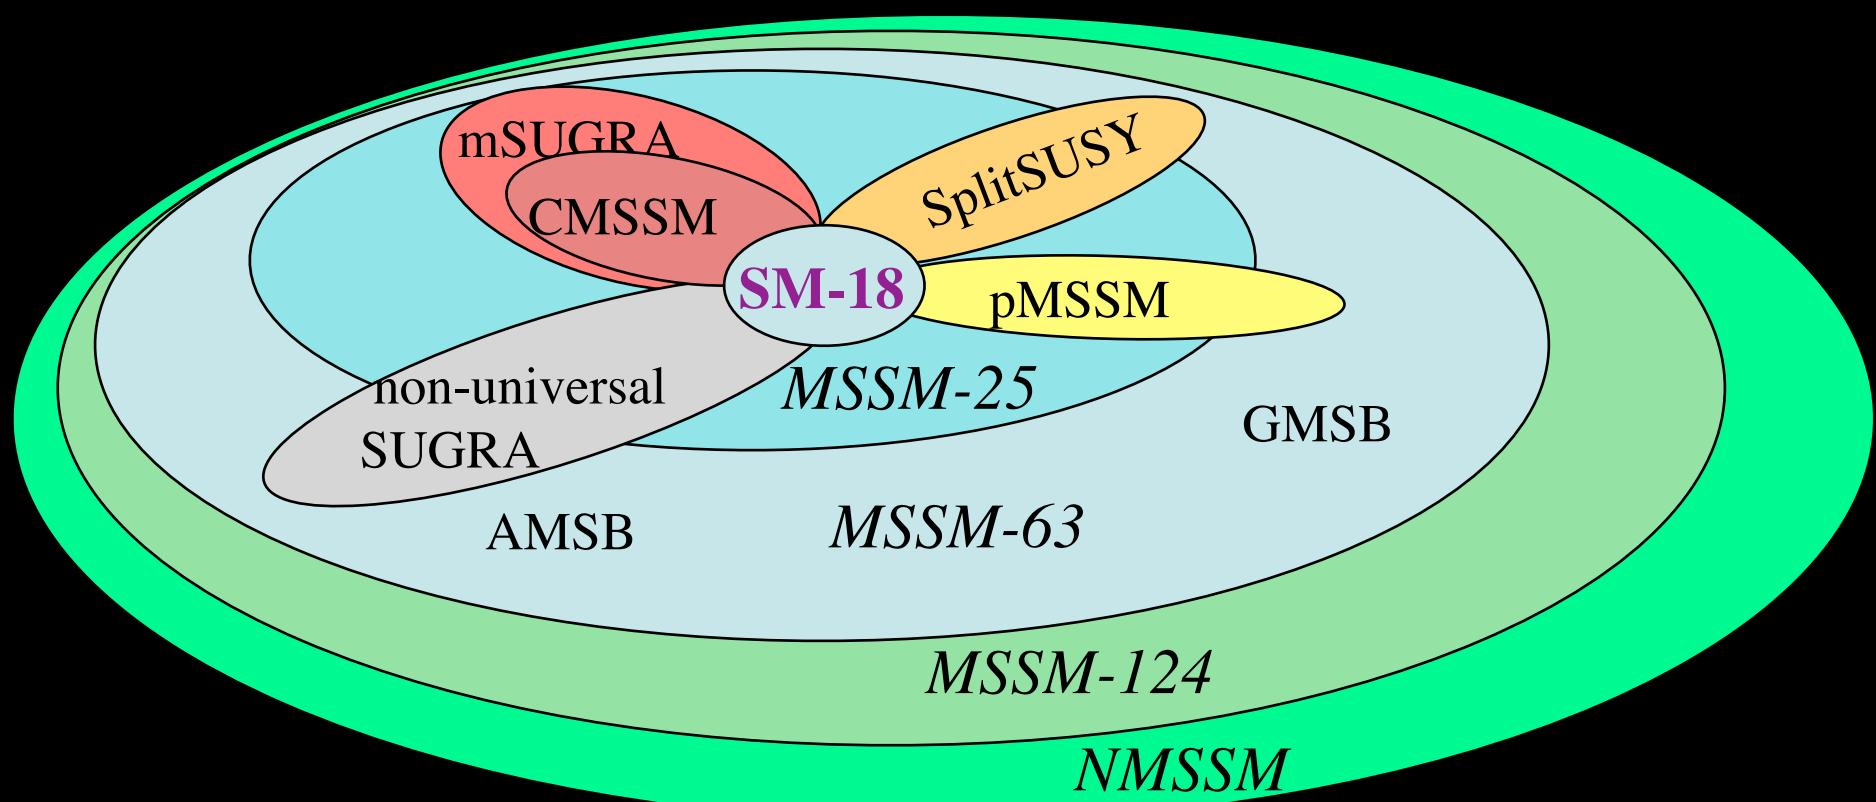

- The CMSSM is in dire straits

*Constrained Minimal
Supersymmetric Standard Model*

“a Higgs mass of ~ 125 GeV excludes the least fine-tuned CMSSM points; remaining viable models may be difficult to probe with dark matter searches”

Sandick 1210.5214

- But there are many supersymmetric models

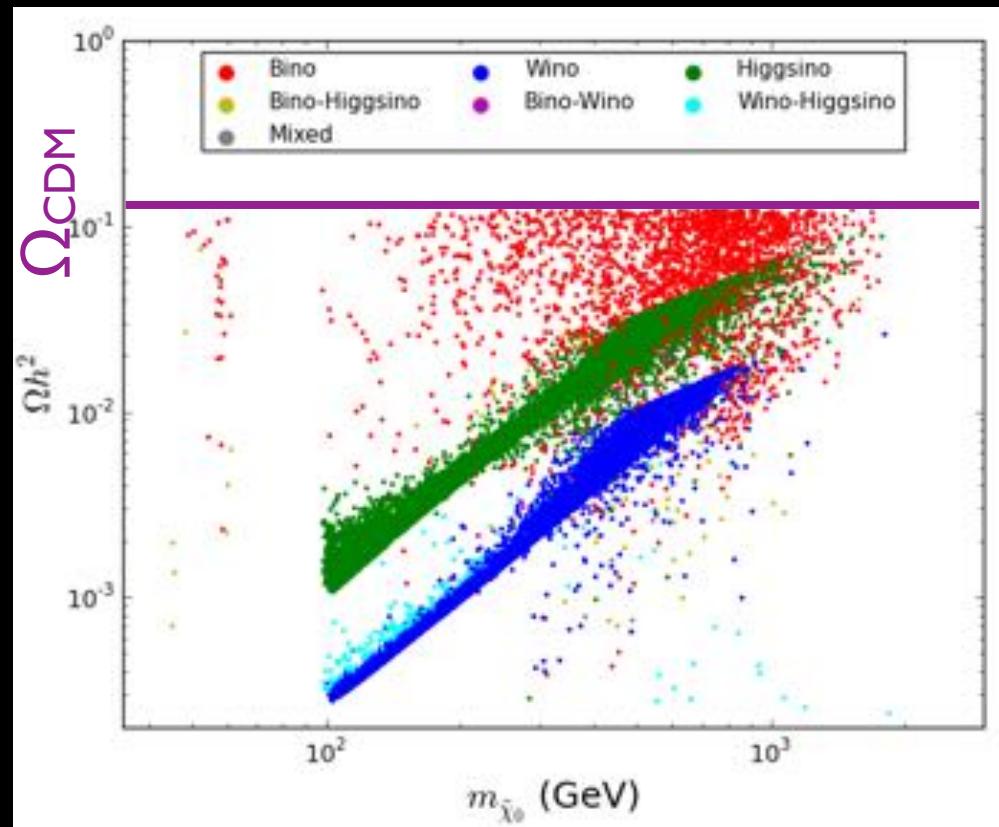

Neutralino dark matter: impact of LHC

Cahill-Rowell et al 1305.6921

“the only pMSSM models remaining [with neutralino being 100% of CDM] are those with bino coannihilation”

pMSSM (phenomenological MSSM)

$\mu, m_A, \tan \beta, A_b, A_t, A_\tau, M_1, M_2, M_3,$
 $m_{Q_1}, m_{Q_3}, m_{u_1}, m_{d_1}, m_{u_3}, m_{d_3},$
 $m_{L_1}, m_{L_3}, m_{e_1}, m_{e_3}$
(19 parameters)

Dynamical dark matter

Dienes, Thomas 2011, 2012

Dienes, Kumar, Thomas 2012, 2013

A vast ensemble of fields
decaying one into another

Example: Kaluza-Klein tower
of axions in extra-dimensions

Phenomenology obtained through scaling laws

$$m_n = m_0 + n^\delta \Delta m,$$

$$\rho_n \sim m_n^\alpha, \tau_n \sim m_n^{-\gamma}$$

X-rays from dark matter?

Sterile neutrino dark matter

The main decay mode of keV sterile neutrinos ($\nu_s \rightarrow 3\nu$) is undetectable

Radiative decay of sterile neutrinos $\nu_s \rightarrow \gamma \nu_a$

X-ray line

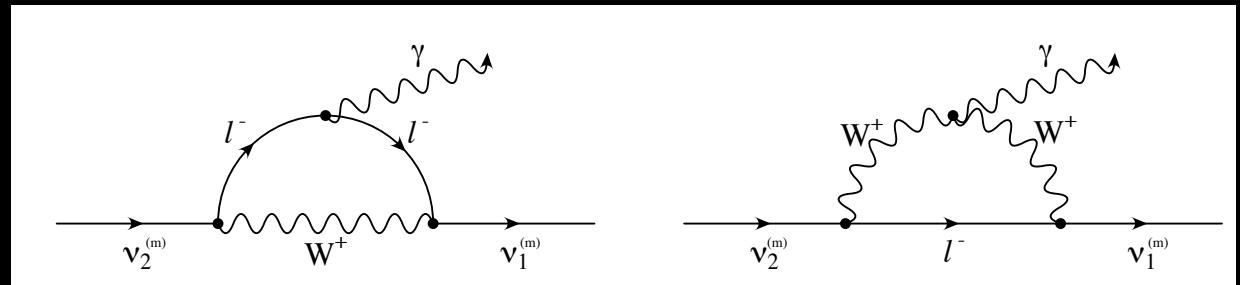

Figure from Kusenko 0906.2968

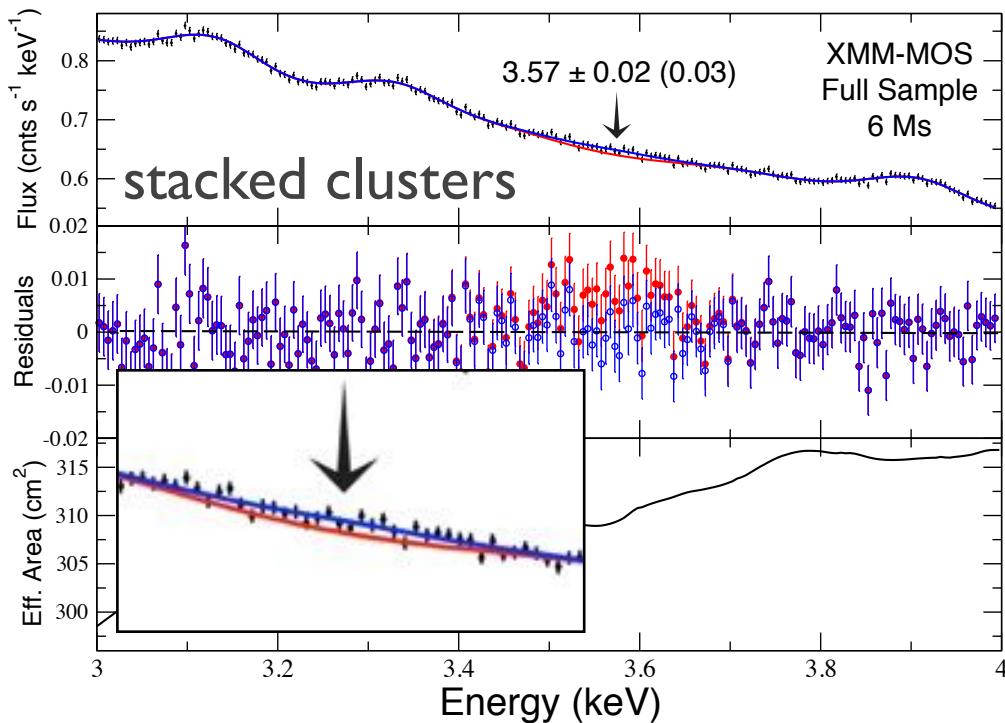

$$E_\gamma = \frac{1}{2} m_s$$

$$\begin{aligned}\Gamma_{\nu_s \rightarrow \gamma \nu_a} &= \frac{9}{256\pi^4} \alpha_{\text{EM}} G_F^2 \sin^2 \theta m_s^5 \\ &= \frac{1}{1.8 \times 10^{21} S} \sin^2 \theta \left(\frac{m_s}{\text{keV}} \right)^5\end{aligned}$$

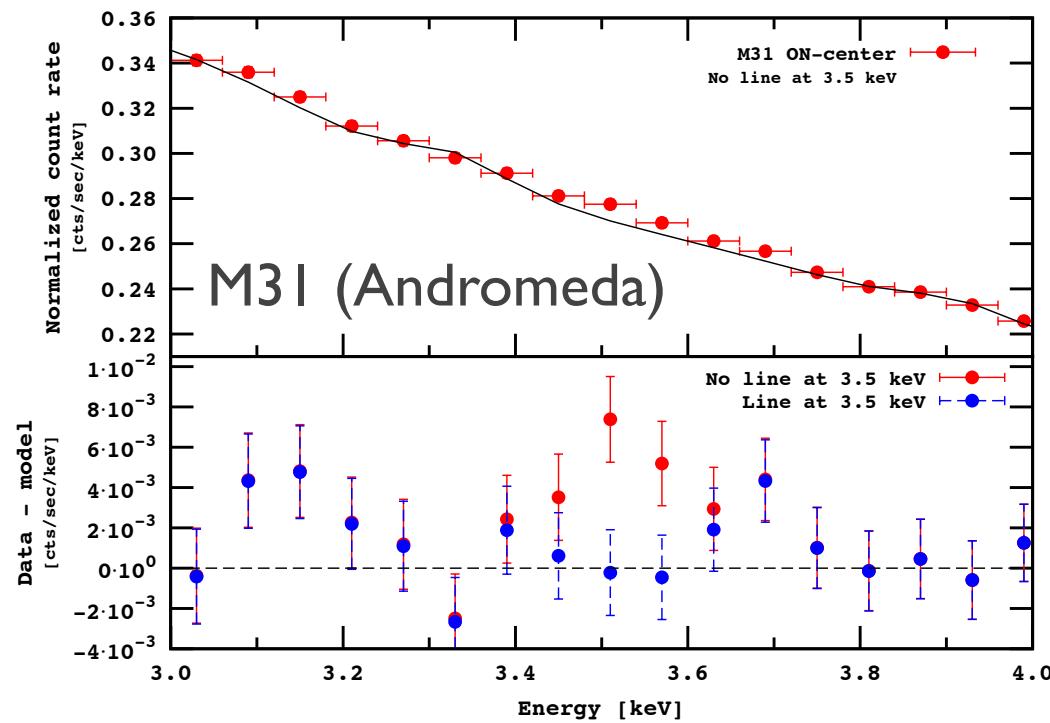

Sterile neutrino dark matter

An unidentified 3.5 keV X-ray line has been reported in stacked images of 73 galaxy clusters and in the Andromeda galaxy

Bulbul et al 2014

Boyarsky et al 2014

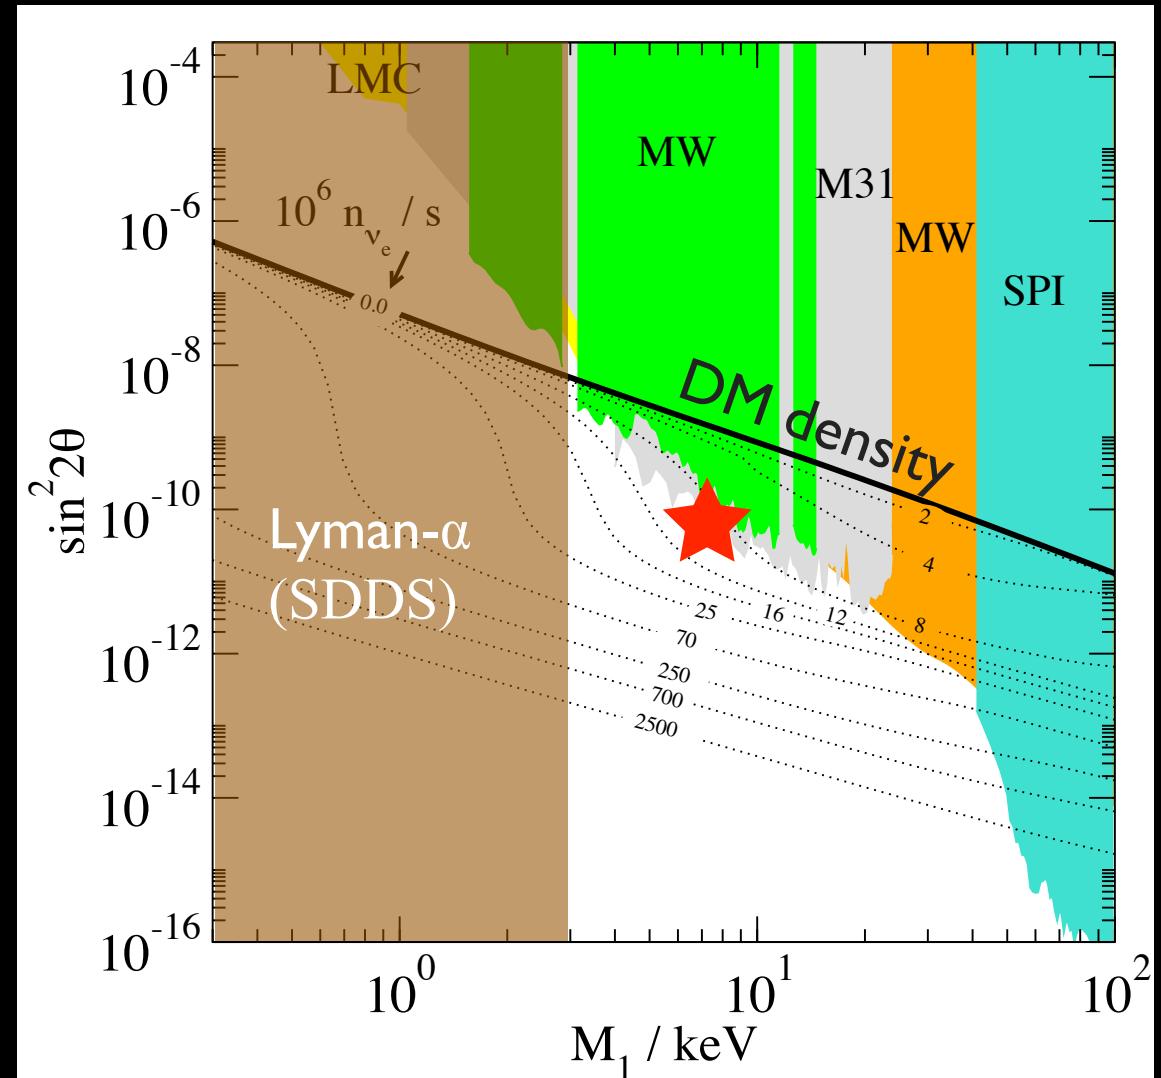

Sterile neutrino dark matter

ν MSM

$$m_\nu = 7.1 \text{ keV}$$

$$\sin^2(2\theta) = 7 \times 10^{-11}$$

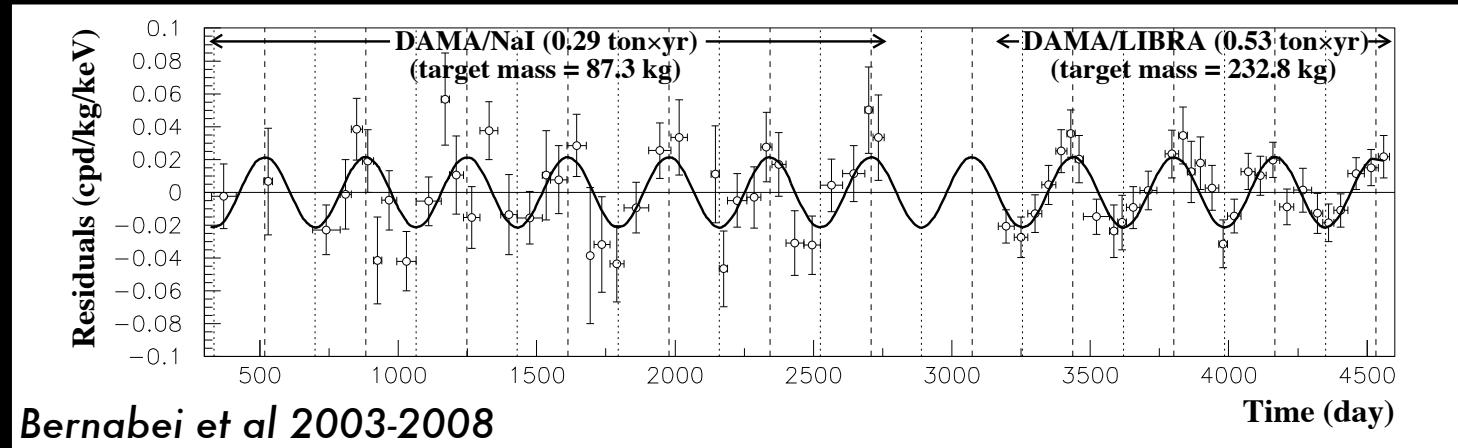

Laine, Shaposhnikov 2008

Direct detection of dark matter?

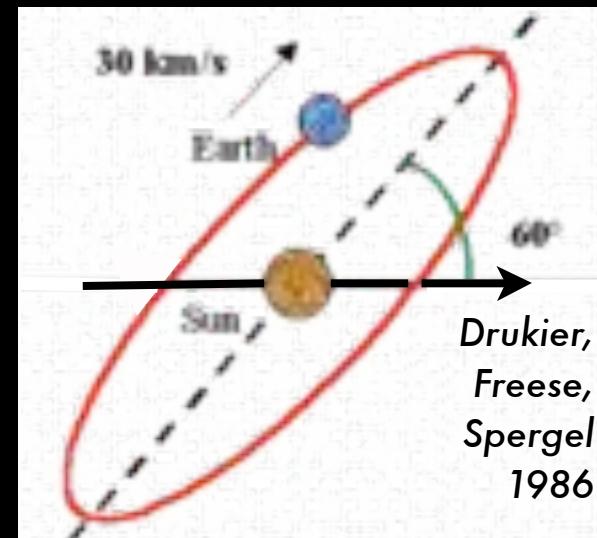

Annual modulation in direct detection

- DAMA observes more nuclei are “hit” in Summer, fewer in Winter

- This is exactly what is expected of dark matter WIMPs

Drukier, Freese, Spergel 1986

DAMA modulation

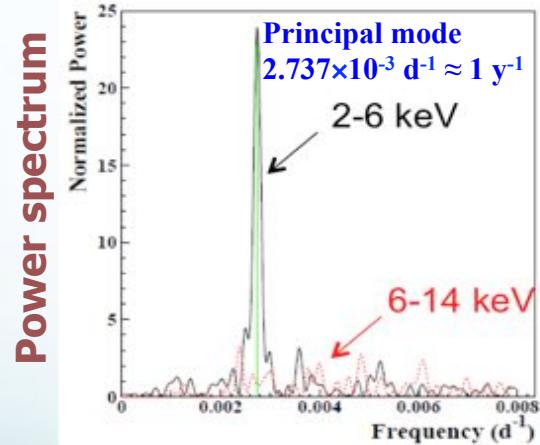

Model Independent Annual Modulation Result

DAMA/NaI + DAMA/LIBRA-phase1 Total exposure: 487526 kg×day = 1.33 ton×yr

EPJC 56(2008)333, EPJC 67(2010)39, EPJC 73(2013)2648

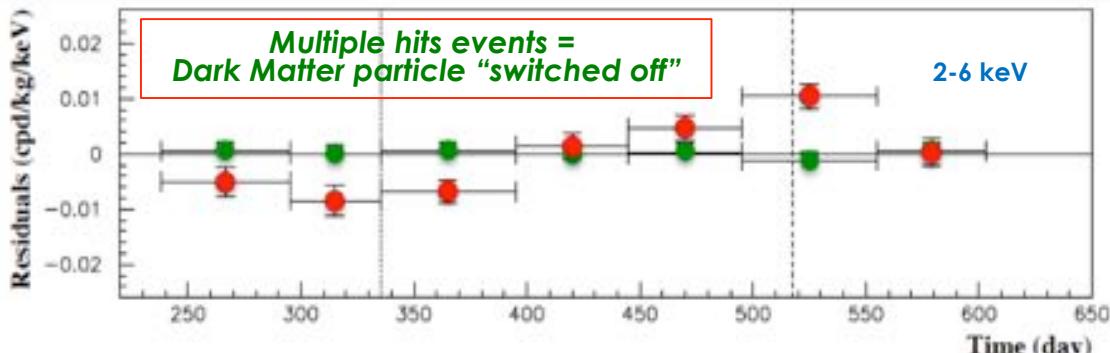

The measured modulation amplitudes (A), period (T) and phase (t_0) from the single-hit residual rate vs time

	A(cpd/kg/keV)	T=2π/ω (yr)	t_0 (day)	C.L.
DAMA/NaI+DAMA/LIBRA-phase1				$\text{Acos}[\omega(t-t_0)]$
(2-4) keV	0.0190 ± 0.0020	0.996 ± 0.0002	134 ± 6	9.5σ
(2-5) keV	0.0140 ± 0.0015	0.996 ± 0.0002	140 ± 6	9.3σ
(2-6) keV	0.0112 ± 0.0012	0.998 ± 0.0002	144 ± 7	9.3σ

No systematics or side reaction able to account for the measured modulation amplitude and to satisfy all the peculiarities of the signature

Comparison between **single hit residual rate (red points)** and **multiple hit residual rate (green points)**; Clear modulation in the single hit events; No modulation in the residual rate of the multiple hit events
 $A=-(0.0005 \pm 0.0004) \text{ cpd/kg/keV}$

This result offers an additional strong support for the presence of DM particles in the galactic halo further excluding any side effect either from hardware or from software procedures or from background

The data favor the presence of a modulated behaviour with all the proper features for DM particles in the galactic halo at about 9.2σ C.L.

DAMA modulation

Model Independent Annual Modulation Result

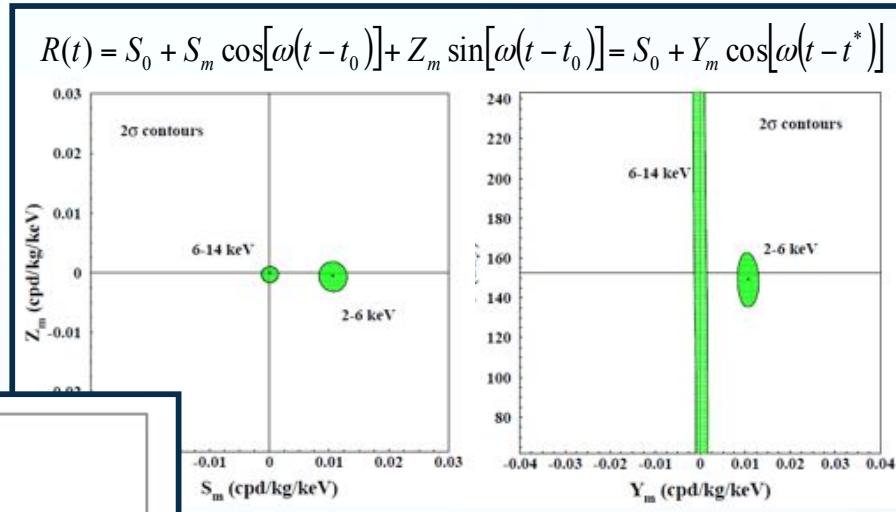

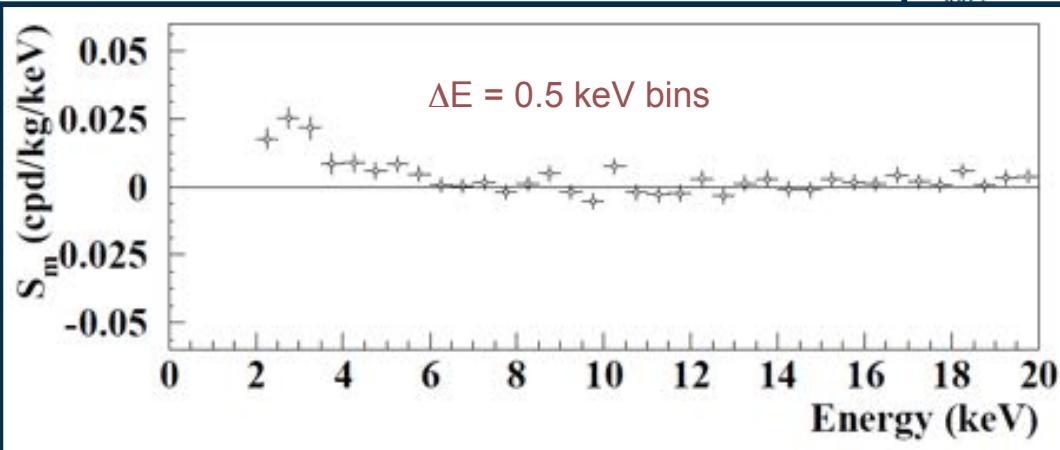

DAMA/Nai + DAMA/LIBRA-phase1 Total exposure: 487526 kg×day = **1.33 ton×yr**

EPJC 56(2008)333, EPJC 67(2010)39, EPJC 73(2013)2648

- No modulation above 6 keV
- No modulation in the whole energy spectrum
- No modulation in the 2-6 keV multiple-hit events

$$R(t) = S_0 + S_m \cos[\omega(t - t_0)]$$

here $T=2\pi/\omega=1$ yr and $t_0=152.5$ day

No systematics or side processes able to quantitatively account for the measured modulation amplitude and to simultaneously satisfy the many peculiarities of the signature are available.

DAMA modulation

**That which does not kill us
makes us stronger**

Make no assumptions

All particle physics models

- Consider all possible interactions between dark matter and standard model particles
- This program has been carried out in some limits (e.g., non-relativistic conditions, heavy mediators)

All astrophysical models

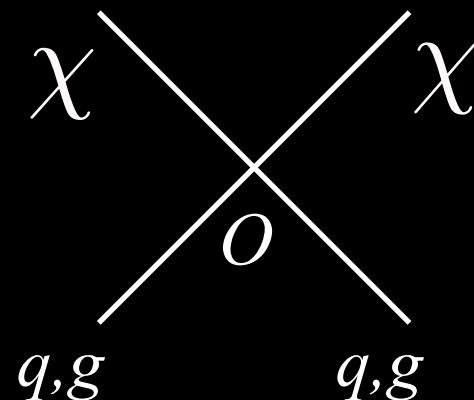

- Halo-independent methods of analysis have been developed
- Ideally they require no assumption on the astrophysical density and velocity distributions of dark matter particles

All particle physics models

Write down and analyze all possible WIMP interactions with ordinary matter

Effective operators

if mediator mass \gg exchanged energy

Four-particle effective operator

There are many possible operators.

Interference is important although often, but not always, neglected.

Long(ish) distance interactions are not included.

Effective operators: LHC & direct detection

Name	Operator	Coefficient
D1	$\bar{\chi}\chi\bar{q}q$	m_q/M_*^3
D2	$\bar{\chi}\gamma^5\chi\bar{q}q$	im_q/M_*^3

Effective operators: direct detection

Combined analysis of short-distance operators

Catena, Gondolo 2014

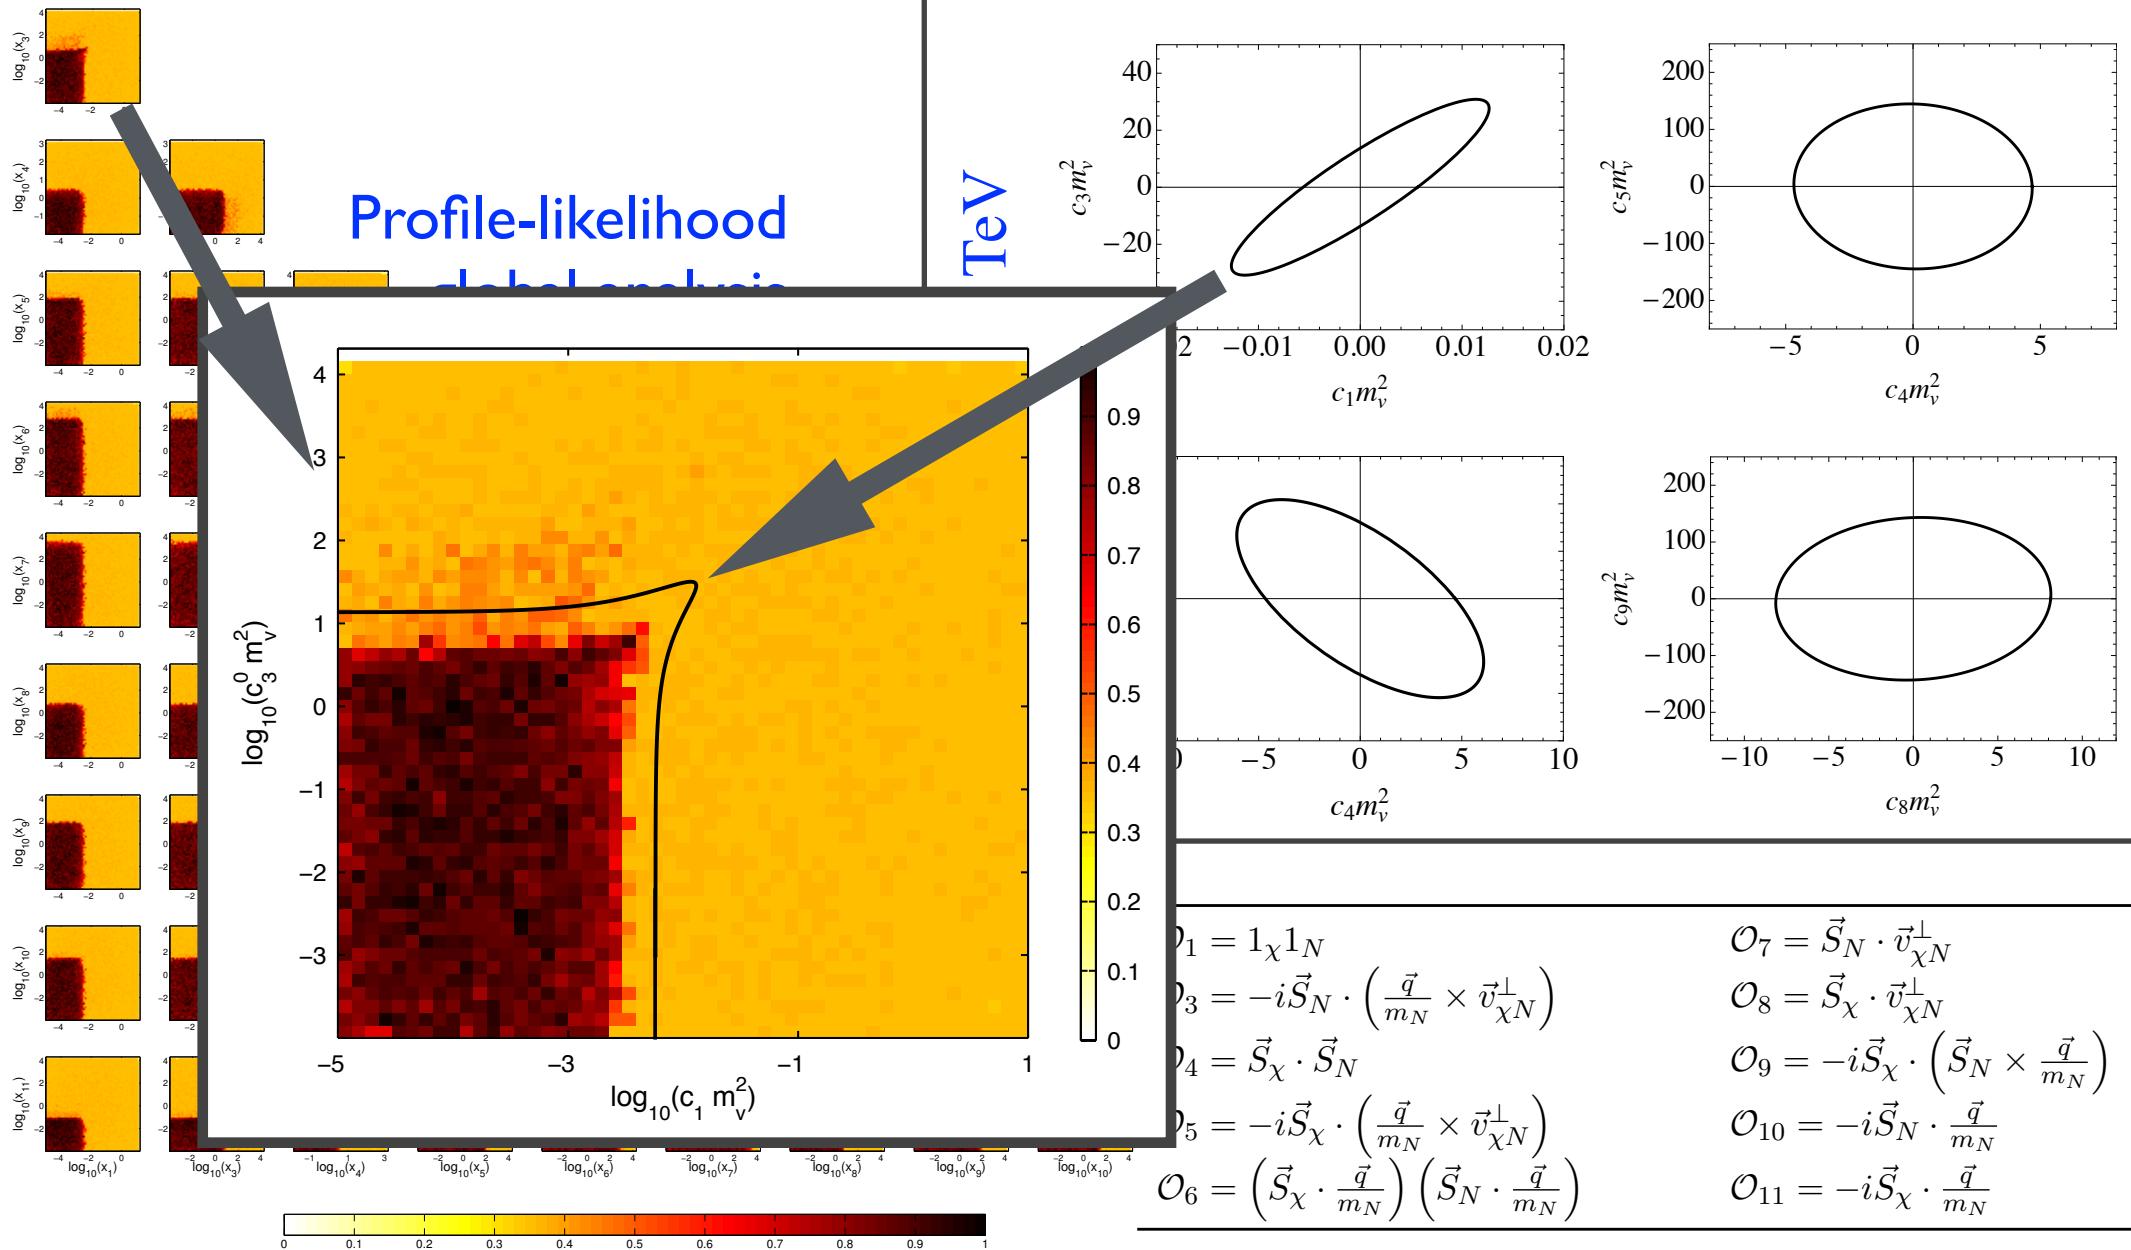

$$\begin{aligned}\mathcal{O}_1 &= 1_\chi 1_N \\ \mathcal{O}_3 &= -i \vec{S}_N \cdot \left(\frac{\vec{q}}{m_N} \times \vec{v}_{\chi N}^\perp \right) \\ \mathcal{O}_4 &= \vec{S}_\chi \cdot \vec{S}_N \\ \mathcal{O}_5 &= -i \vec{S}_\chi \cdot \left(\frac{\vec{q}}{m_N} \times \vec{v}_{\chi N}^\perp \right) \\ \mathcal{O}_6 &= \left(\vec{S}_\chi \cdot \frac{\vec{q}}{m_N} \right) \left(\vec{S}_N \cdot \frac{\vec{q}}{m_N} \right) \\ \mathcal{O}_7 &= \vec{S}_N \cdot \vec{v}_{\chi N}^\perp \\ \mathcal{O}_8 &= \vec{S}_\chi \cdot \vec{v}_{\chi N}^\perp \\ \mathcal{O}_9 &= -i \vec{S}_\chi \cdot \left(\vec{S}_N \times \frac{\vec{q}}{m_N} \right) \\ \mathcal{O}_{10} &= -i \vec{S}_N \cdot \frac{\vec{q}}{m_N} \\ \mathcal{O}_{11} &= -i \vec{S}_\chi \cdot \frac{\vec{q}}{m_N}\end{aligned}$$

Effective operators: direct detection

Combined analysis of short-distance operators

Catena, Gondolo 2014

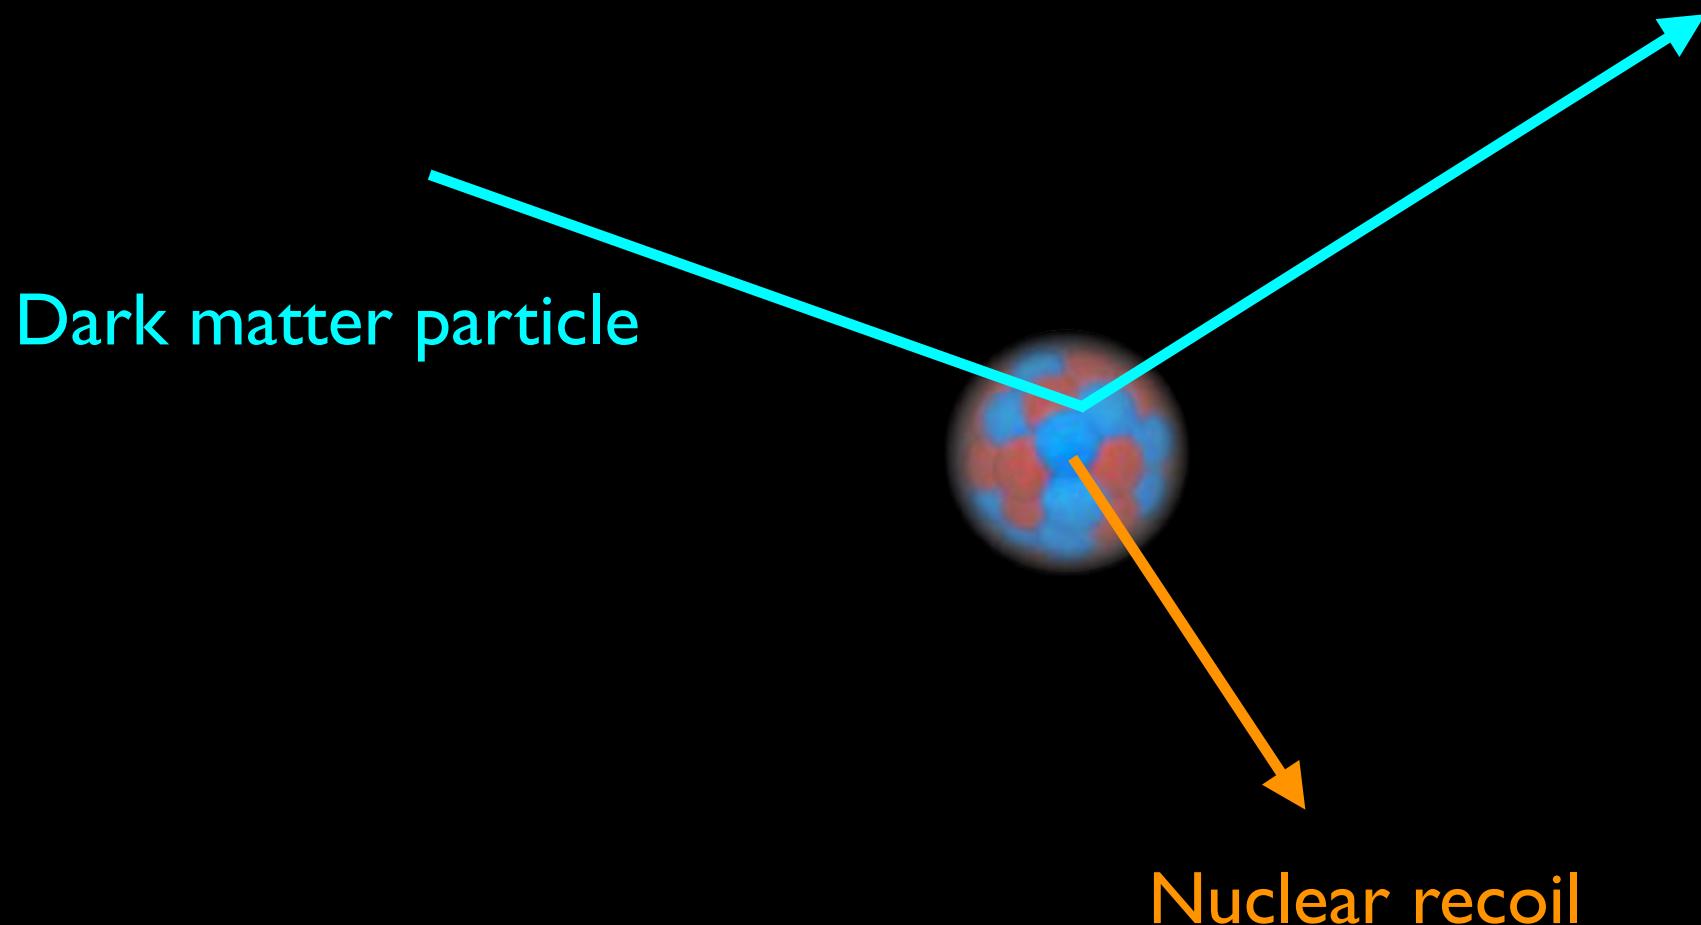

All astrophysics models

Do not assume any particular
WIMP density or velocity distribution

DM-nucleus elastic scattering

$$\begin{pmatrix} \text{event} \\ \text{rate} \end{pmatrix} = \begin{pmatrix} \text{detector} \\ \text{response} \end{pmatrix} \times \begin{pmatrix} \text{particle} \\ \text{physics} \end{pmatrix} \times (\text{astrophysics})$$

Detector response model

$$\begin{pmatrix} \text{event} \\ \text{rate} \end{pmatrix} = \boxed{\begin{pmatrix} \text{detector} \\ \text{response} \end{pmatrix}} \times \begin{pmatrix} \text{particle} \\ \text{physics} \end{pmatrix} \times (\text{astrophysics})$$

Is a nuclear recoil detectable?

Counting efficiency, energy resolution, scintillation response, etc.

$$\begin{pmatrix} \text{detector} \\ \text{response} \end{pmatrix} = \mathcal{G}(E, E_R)$$

Probability of detecting an event with energy (or number of photoelectrons) E , given an event occurred with recoil energy E_R .

Particle physics model

$$\begin{pmatrix} \text{event} \\ \text{rate} \end{pmatrix} = \begin{pmatrix} \text{detector} \\ \text{response} \end{pmatrix} \times \boxed{\begin{pmatrix} \text{particle} \\ \text{physics} \end{pmatrix}} \times (\text{astrophysics})$$

What force couples dark matter to nuclei?

Coupling to nucleon number density, nucleon spin density, ...

$$\begin{pmatrix} \text{particle} \\ \text{physics} \end{pmatrix} = \frac{v^2}{m} \frac{d\sigma}{dE_R}$$

WIMP speed

WIMP mass

Nucleus recoil energy

WIMP-nucleus cross section:
*spin-independent, spin-dependent,
electric, magnetic, ...*

Astrophysics model

$$\begin{pmatrix} \text{event} \\ \text{rate} \end{pmatrix} = \begin{pmatrix} \text{detector} \\ \text{response} \end{pmatrix} \times \begin{pmatrix} \text{particle} \\ \text{physics} \end{pmatrix} \times \boxed{\text{(astrophysics)}}$$

How much dark matter comes to Earth?

$$(\text{astrophysics}) = \eta(v_{\min}, t) \equiv \rho_\chi \int_{v > v_{\min}} \frac{f(\mathbf{v}, t)}{v} d^3v$$

Local halo density

Velocity distribution

Minimum WIMP speed to impart recoil energy E_R

$$v_{\min} = (ME_R/\mu + \delta)/\sqrt{2ME_R}$$

Astrophysics model: velocity distribution

Standard Halo Model

truncated Maxwellian

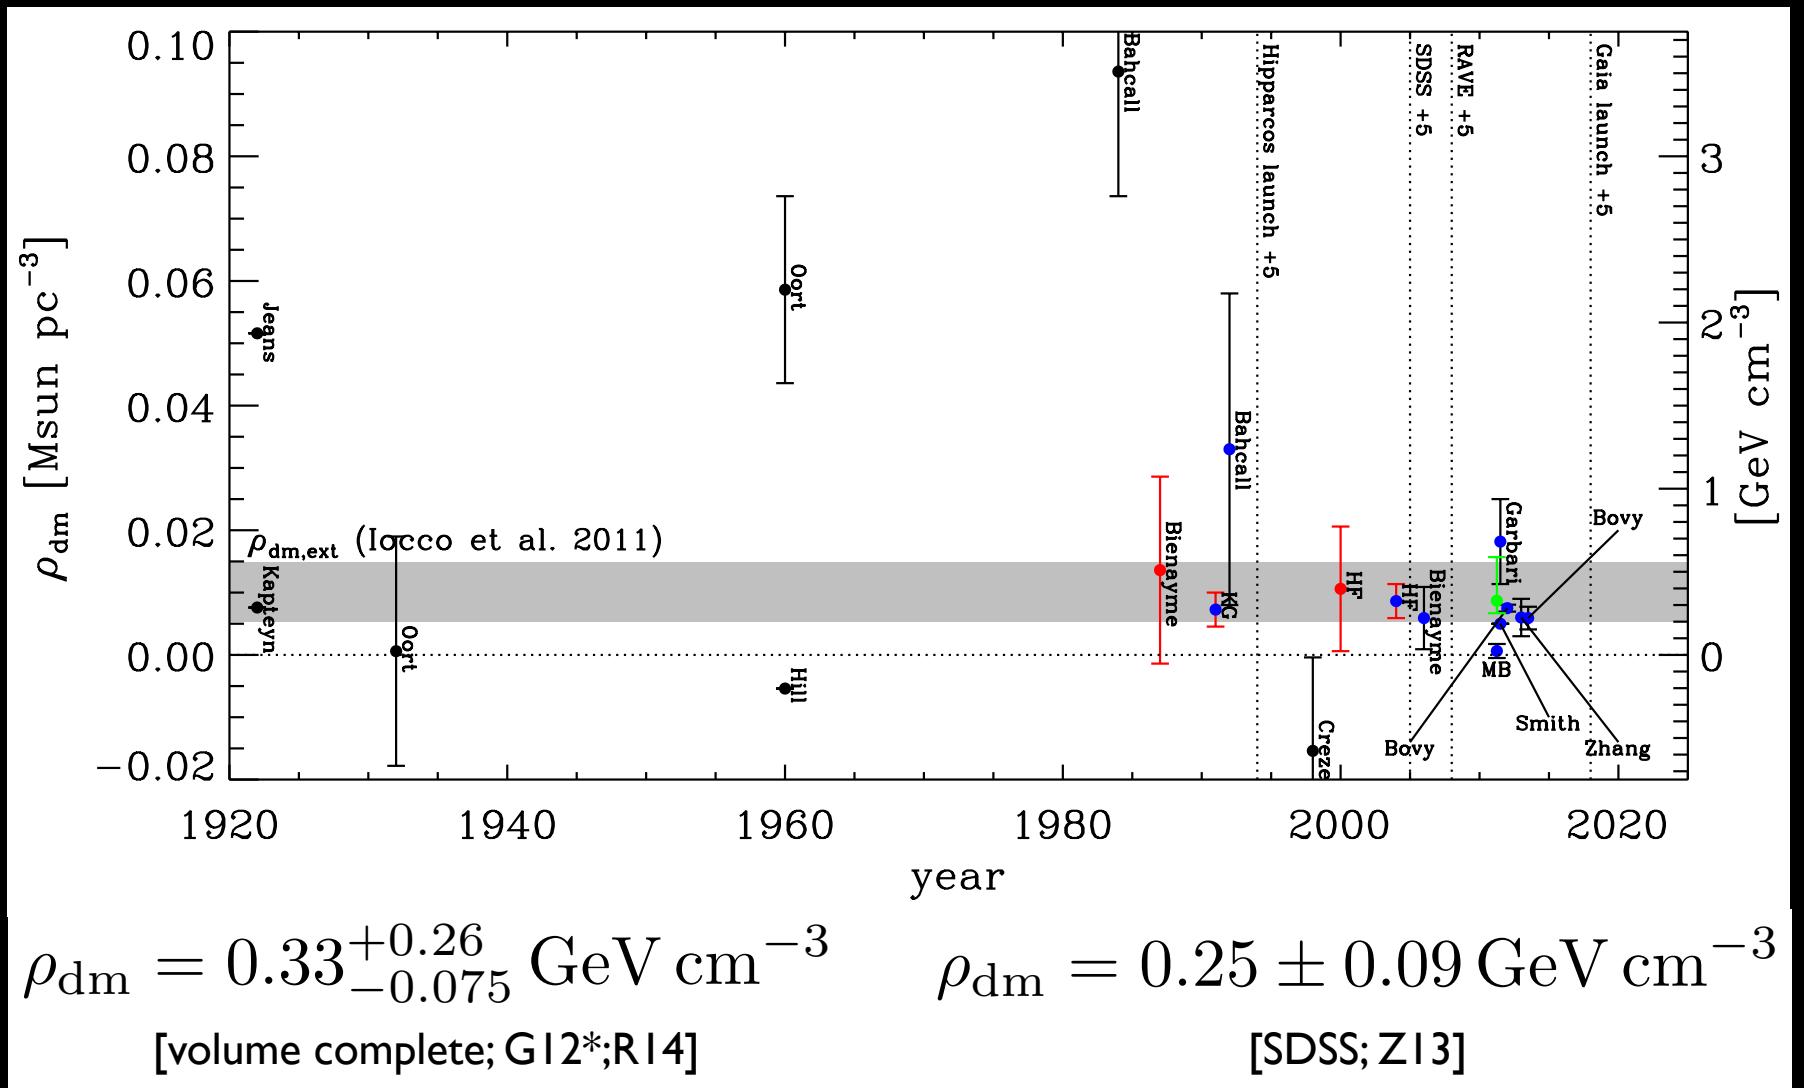

$$f(\mathbf{v}) = \begin{cases} \frac{1}{N_{\text{esc}} \pi^{3/2} \bar{v}_0^3} e^{-|\mathbf{v} + \mathbf{v}_{\text{obs}}|/\bar{v}_0^2} & |\mathbf{v}| < v_{\text{esc}} \\ 0 & \text{otherwise} \end{cases}$$

The spherical cow of direct WIMP searches

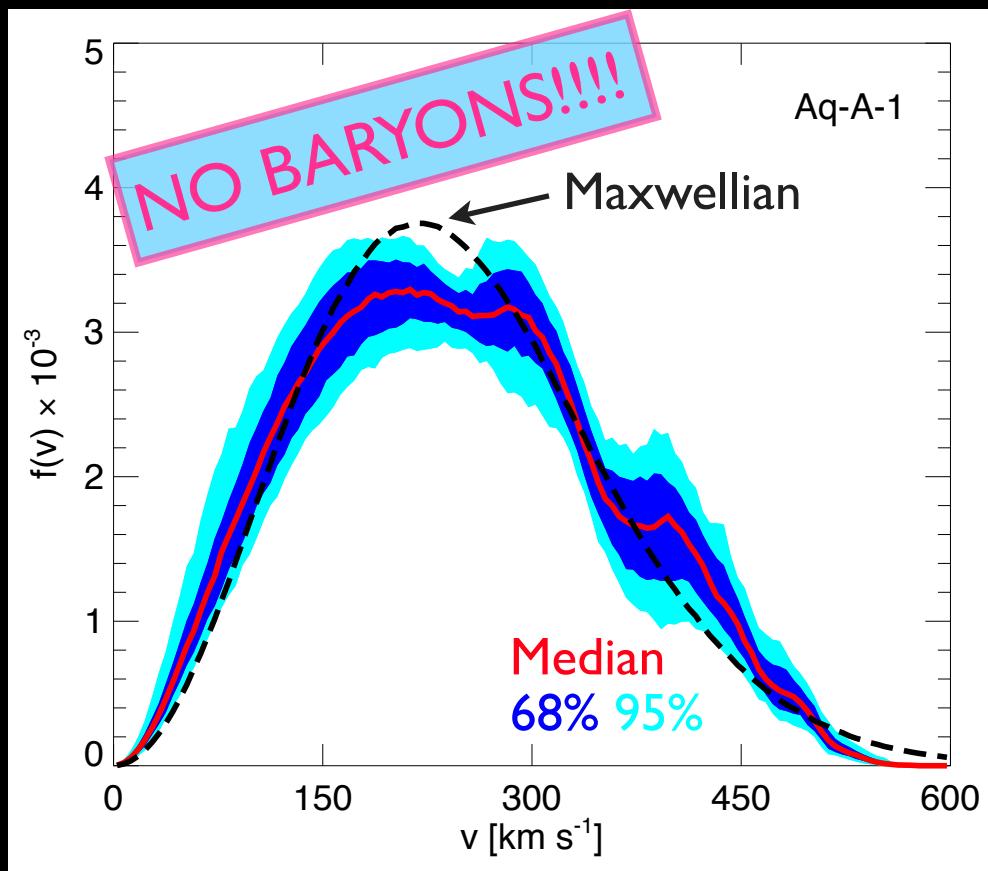

Astrophysics model: local density

The dark matter density near the Solar System
is known reasonably well

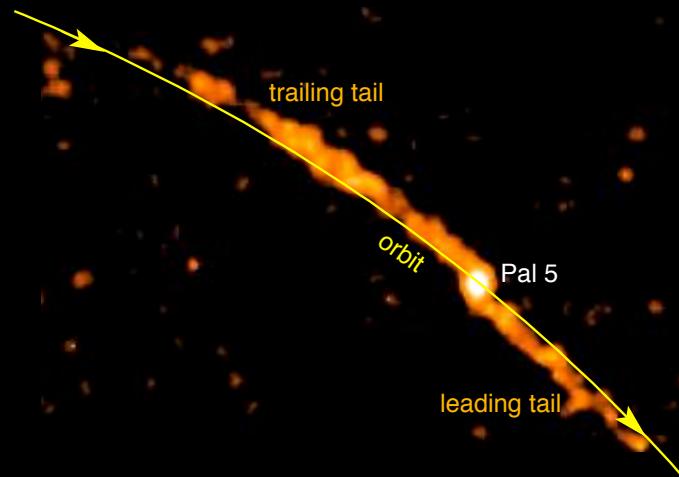

Astrophysics model: velocity distribution

We know very little about the dark matter velocity distribution near the Sun

Vogelsberger et al 2009

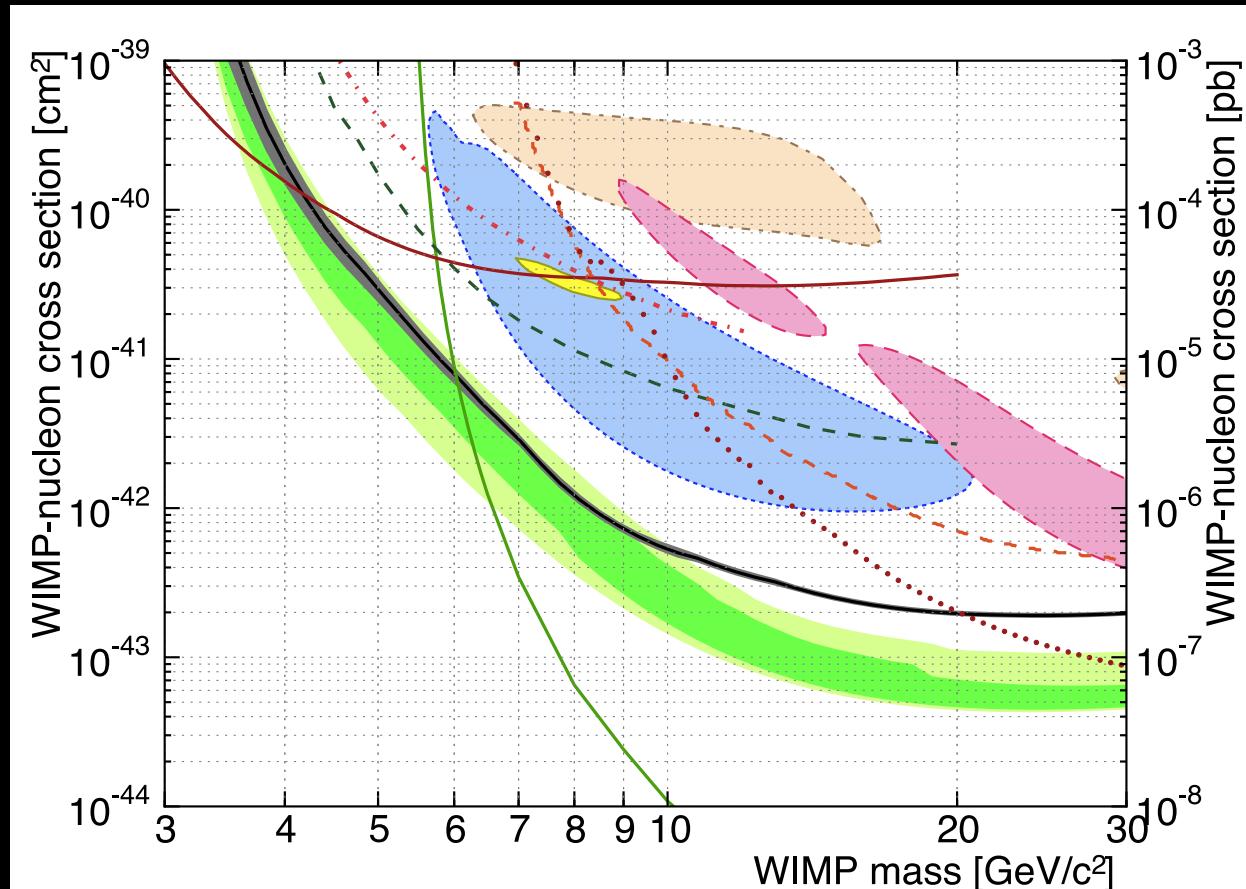

Odenkirchen et al 2002 (SDSS)
Streams of stars have been observed in the galactic halo
SDSS, 2MASS, SEGUE,.....

Cosmological N-Body simulations including baryons are challenging but underway

Astrophysics model: velocity distribution

$$\begin{pmatrix} \text{event} \\ \text{rate} \end{pmatrix} = \begin{pmatrix} \text{detector} \\ \text{response} \end{pmatrix} \times \boxed{\begin{pmatrix} \text{particle} \\ \text{physics} \end{pmatrix}} \times \boxed{\text{(astrophysics)}}$$

FIXED **FIXED**

Agnese et al (SuperCDMS) 2014

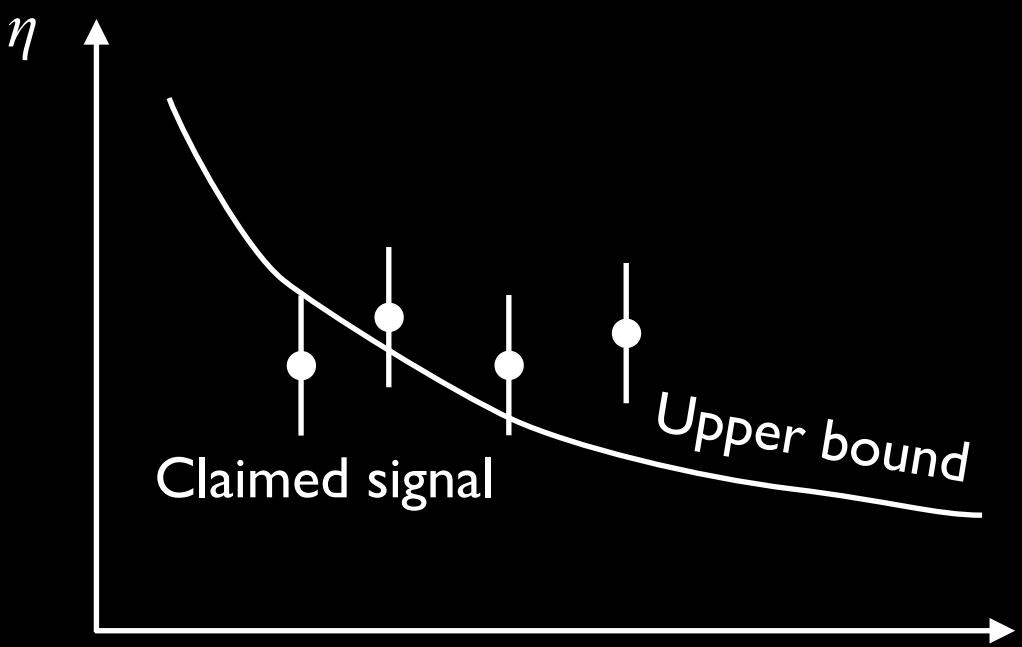

Astrophysics-independent approach

$$\begin{pmatrix} \text{event} \\ \text{rate} \end{pmatrix} = \begin{pmatrix} \text{detector} \\ \text{response} \end{pmatrix} \times \boxed{\begin{pmatrix} \text{particle} \\ \text{physics} \end{pmatrix}} \times \boxed{\begin{pmatrix} \text{astrophysics} \end{pmatrix}}$$

FIXED ARBITRARY

Rescaled astrophysics factor common to all experiments

$$\tilde{\eta}(v_{\min}) = \sigma_{\chi p} \frac{\rho_\chi}{m_\chi} \int_{v_{\min}}^{\infty} \frac{f(\mathbf{v})}{v} d^3v$$

Minimum WIMP speed
to impart recoil energy E_R

Astrophysics-independent approach

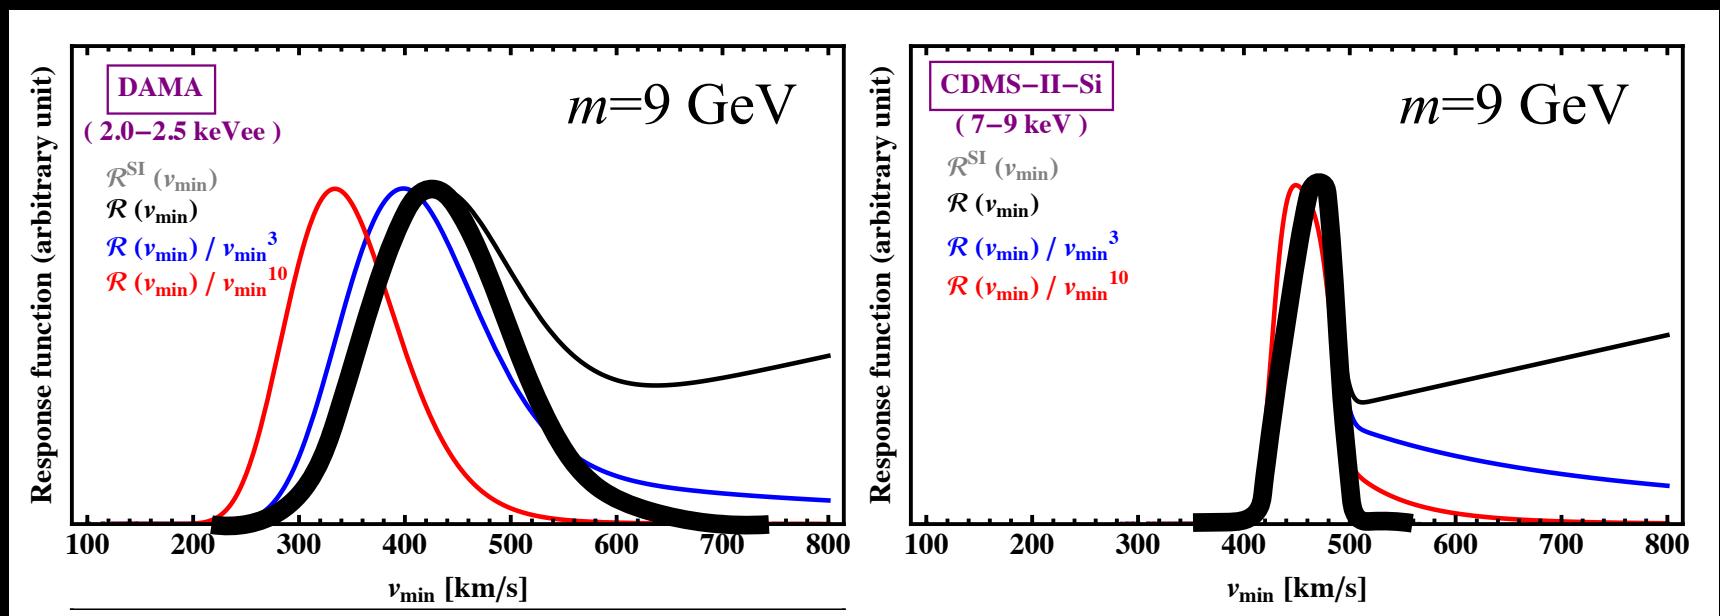

Gondolo Gelmini 2012

- The measured rate is a “**weighted average**” of the astrophysical factor.

$$R = \int_0^\infty dv \mathcal{R}(v) \tilde{\eta}(v)$$

Measured rate Rescaled astrophysics factor
Response function

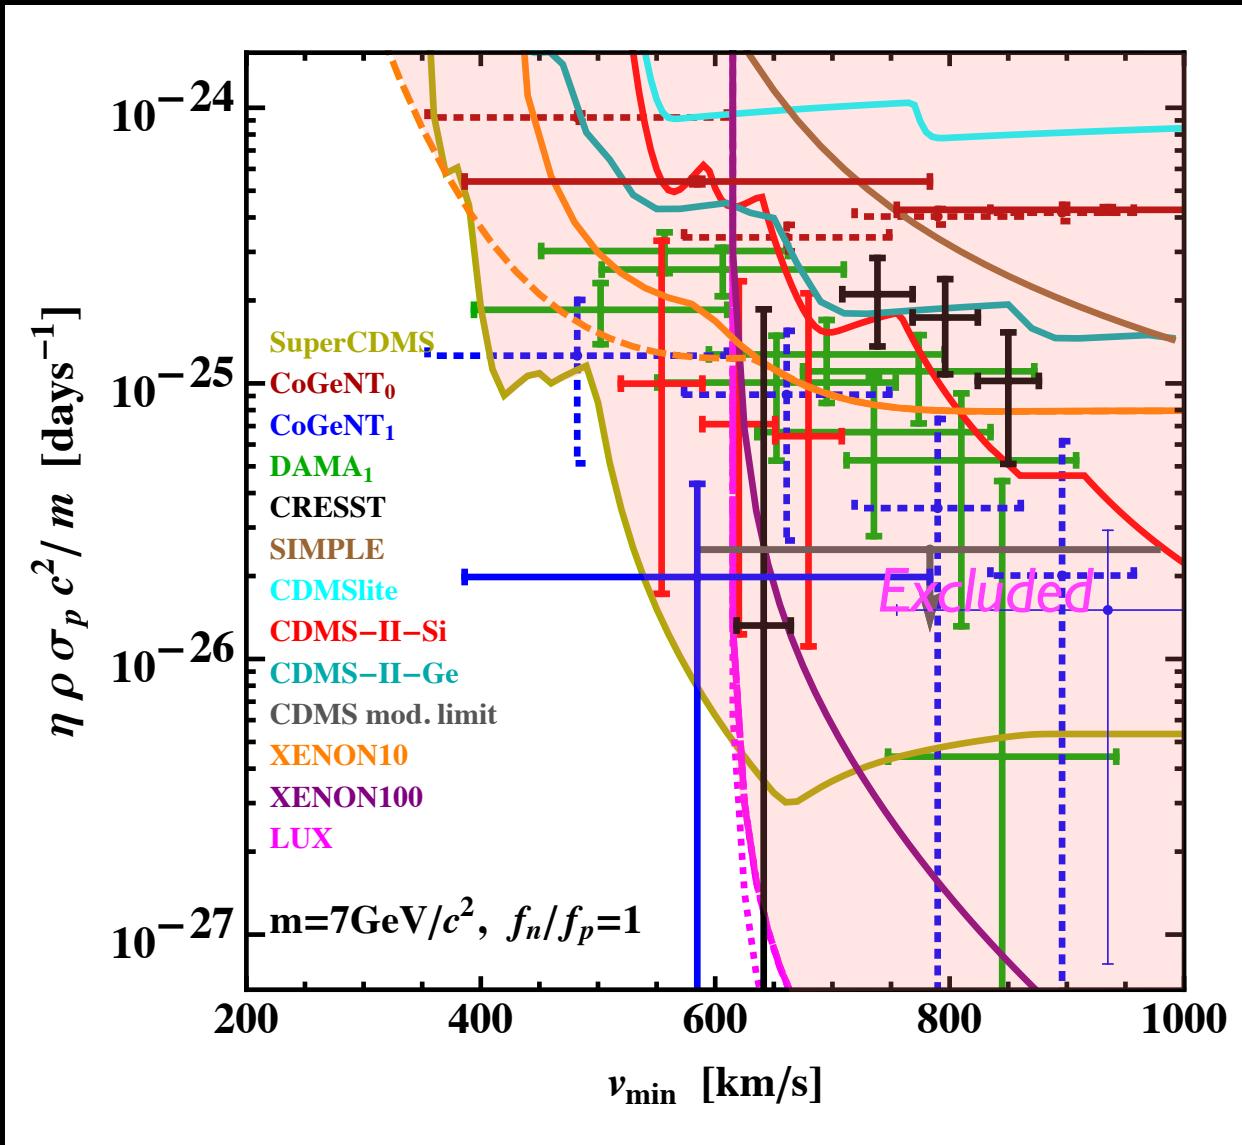

- Every experiment is sensitive to a “**window in velocity space**.”

Spin-independent isoscalar interactions

$$\sigma_{\chi A} = A^2 \sigma_{\chi p} \mu_{\chi A}^2 / \mu_{\chi p}^2$$

Astrophysics-independent approach

Halo modifications alone cannot save the SI signal regions from the Xe and Ge bounds

CDMS-Si event rate is similar to yearly modulated rates

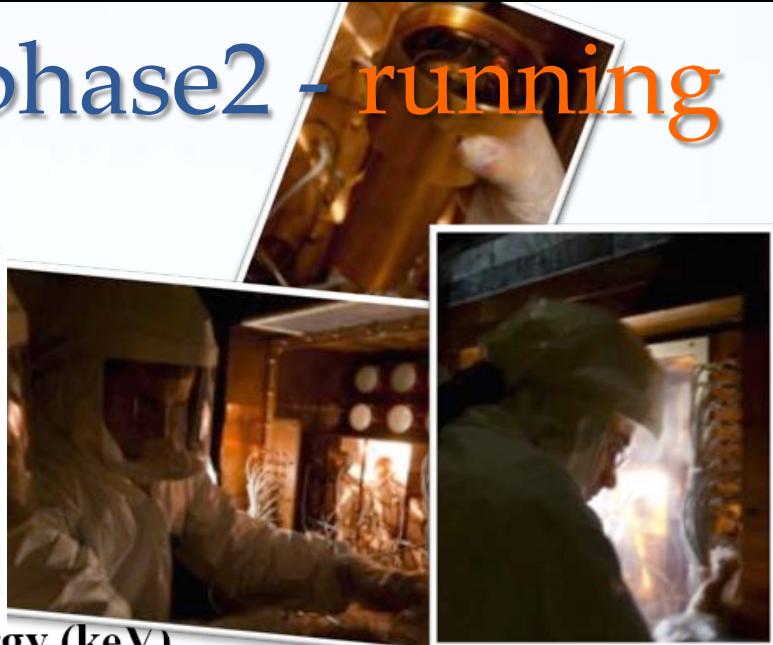

Still depends on particle model

Residual Contamination

PMT	Time (s)	Mass (kg)	^{226}Ra (Bq/kg)	^{234m}Pa (Bq/kg)	^{235}U (mBq/kg)	^{228}Ra (Bq/kg)	^{228}Th (mBq/kg)	^{40}K (Bq/kg)	^{137}Cs (mBq/kg)	^{60}Co (mBq/kg)
Average			0.43	-	47	0.12	83	0.54	-	-
Standard deviation			0.06	-	10	0.02	17	0.16	-	-

$\sigma/E @ 59.5 \text{ keV}$ for each detector with new PMTs with higher quantum efficiency (blue points) and with previous PMT EMI-Electron Tube (red points).

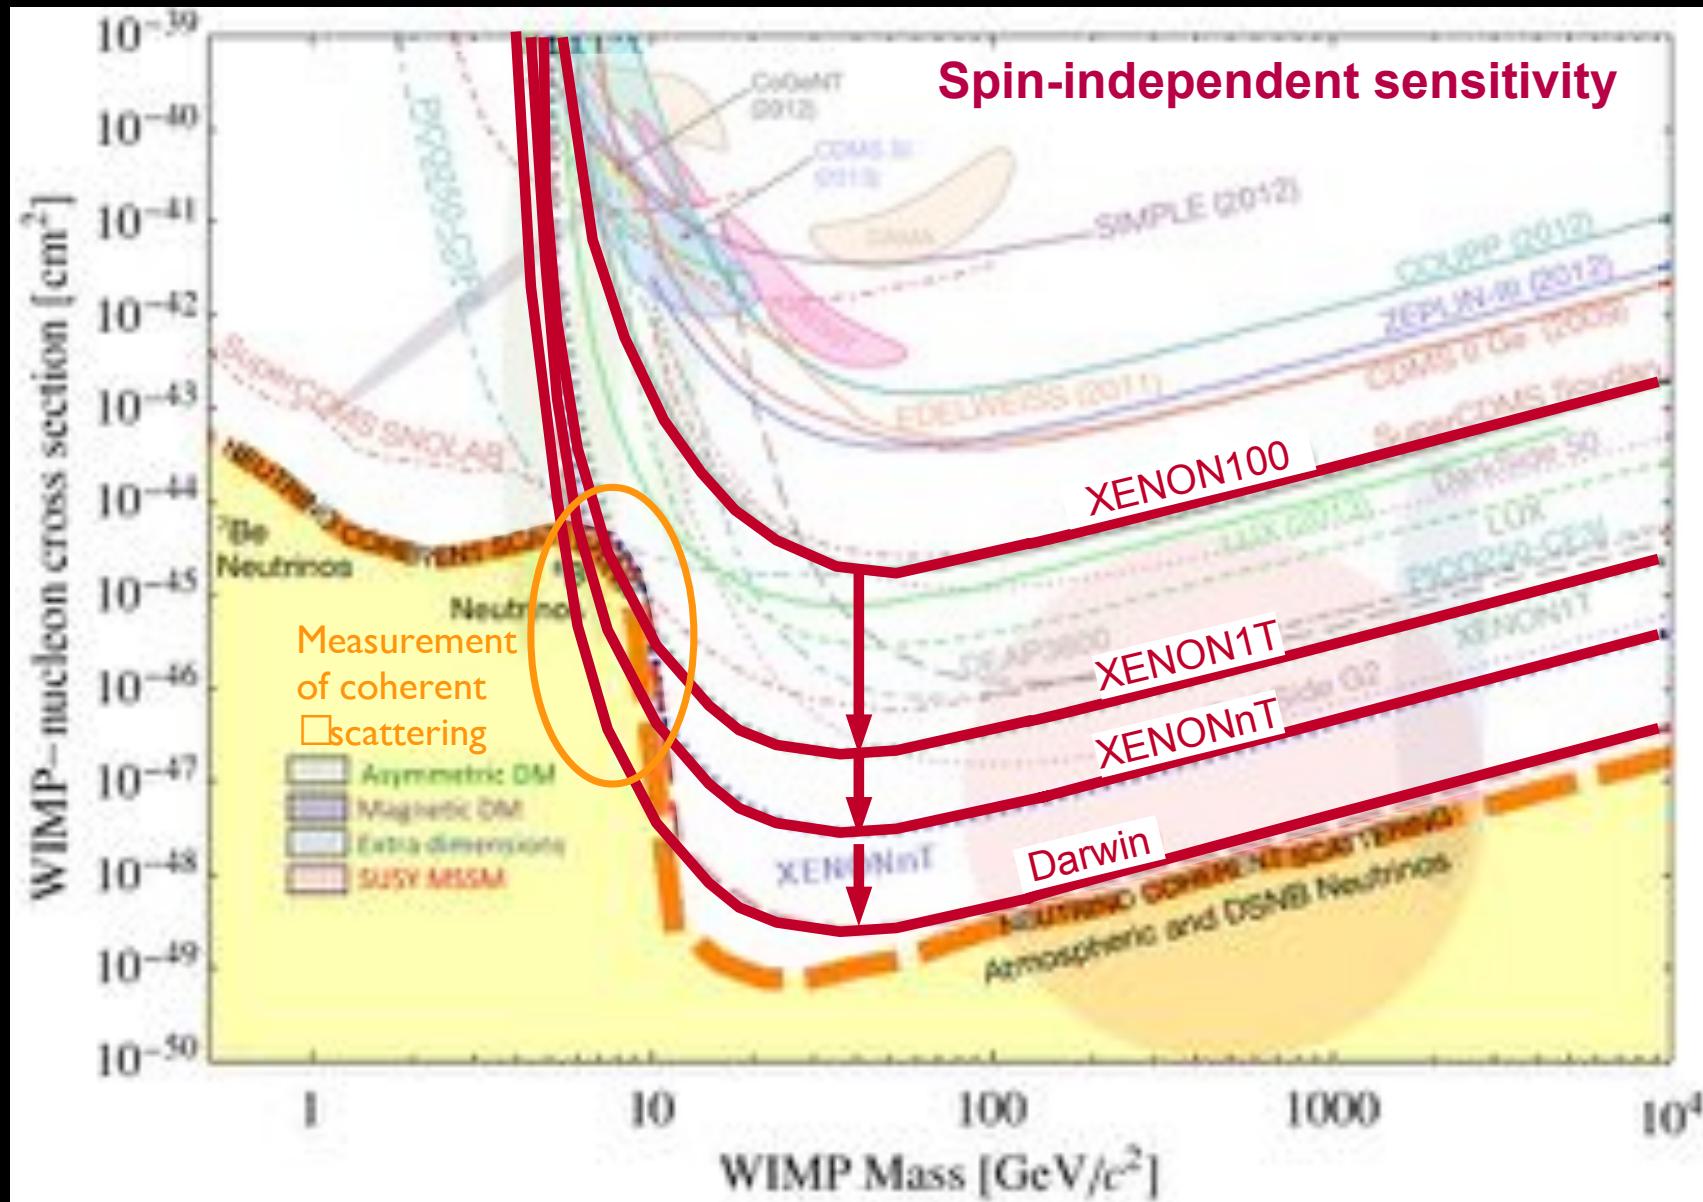

The light responses

Previous PMTs: 5.5-7.5 ph.e./keV
New PMTs: up to 10 ph.e./keV

- To study the nature of the particles and features of related astrophysical, nuclear and particle physics aspects, and to investigate second order effects
- Special data taking for *other rare processes*

In the next episodes.... Giant detectors

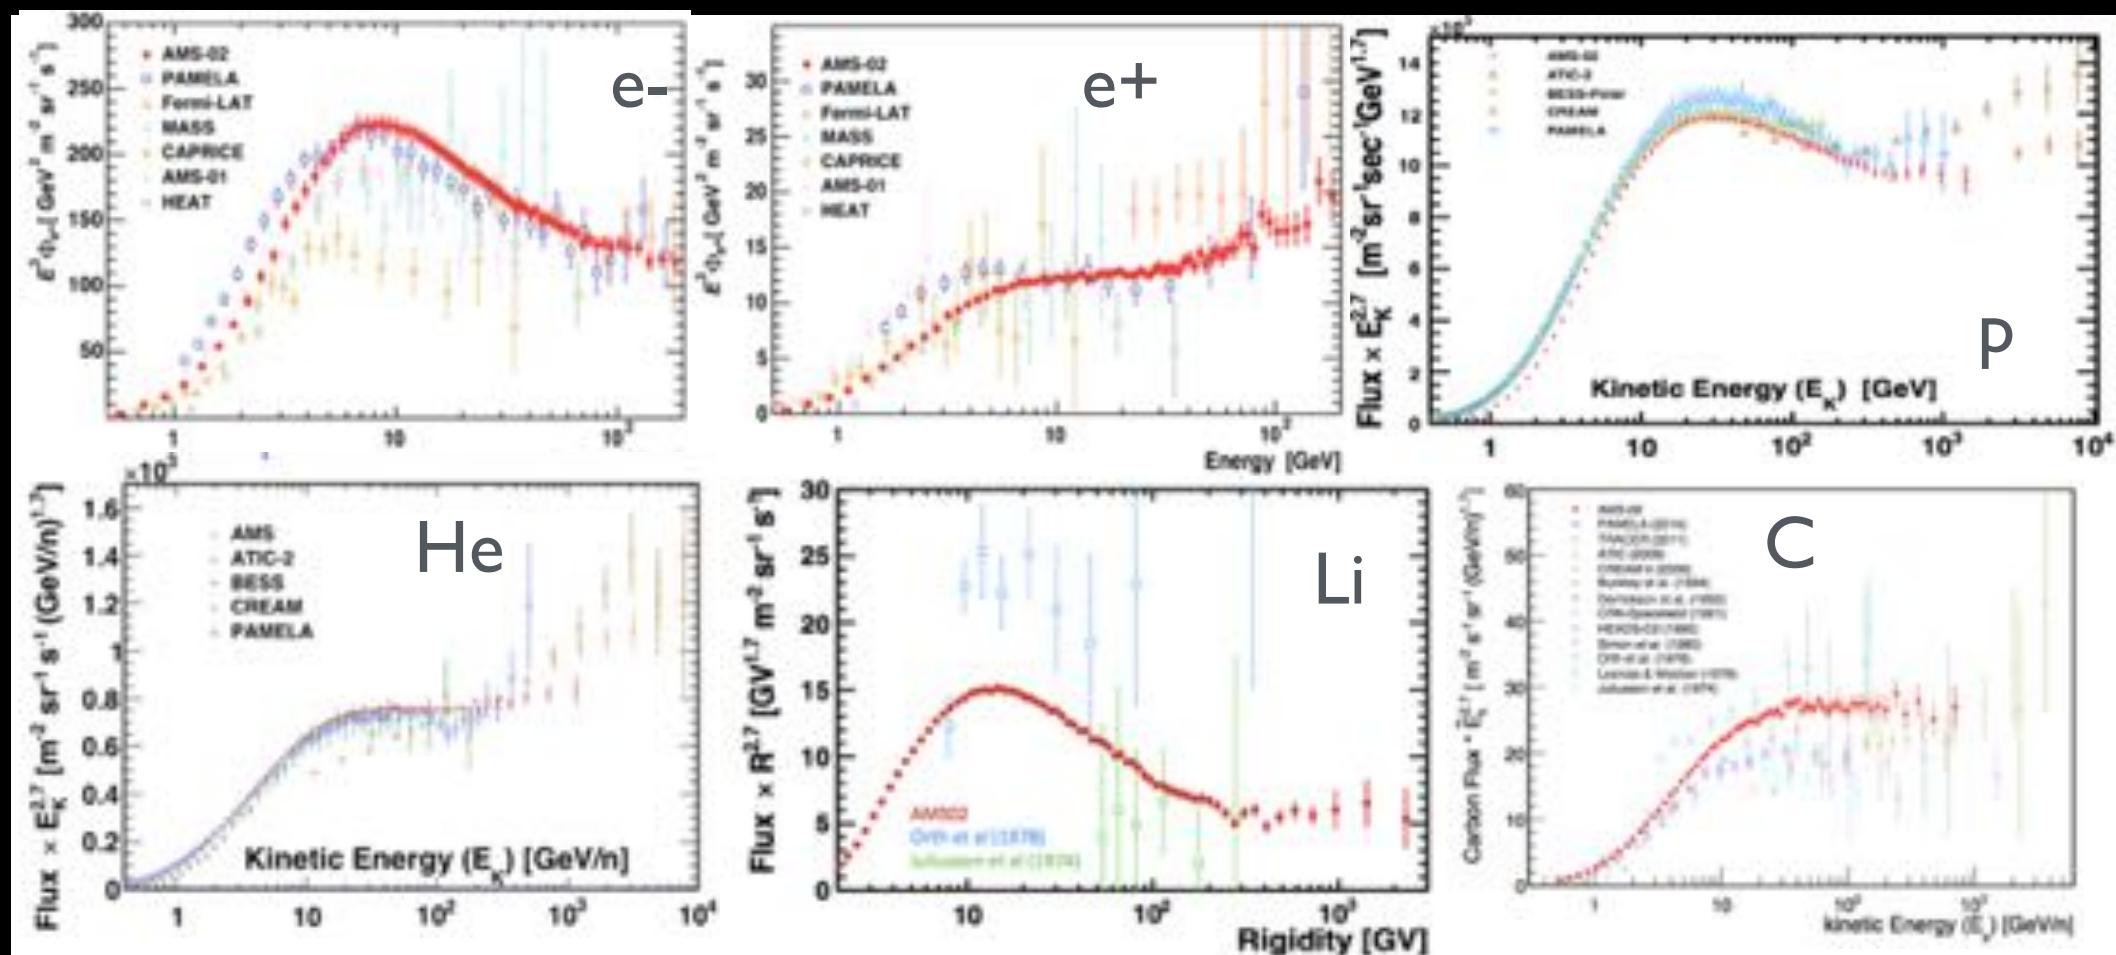

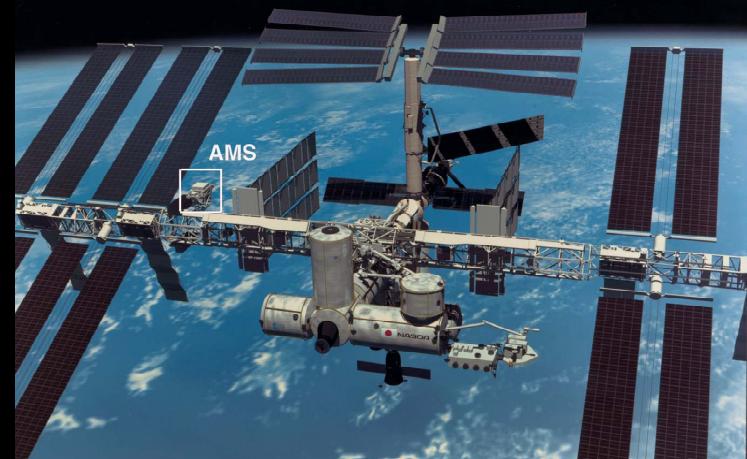

SuperCDMS, XENON1T, XENONnT, Darwin,

In the next episodes.... Precision cosmic rays

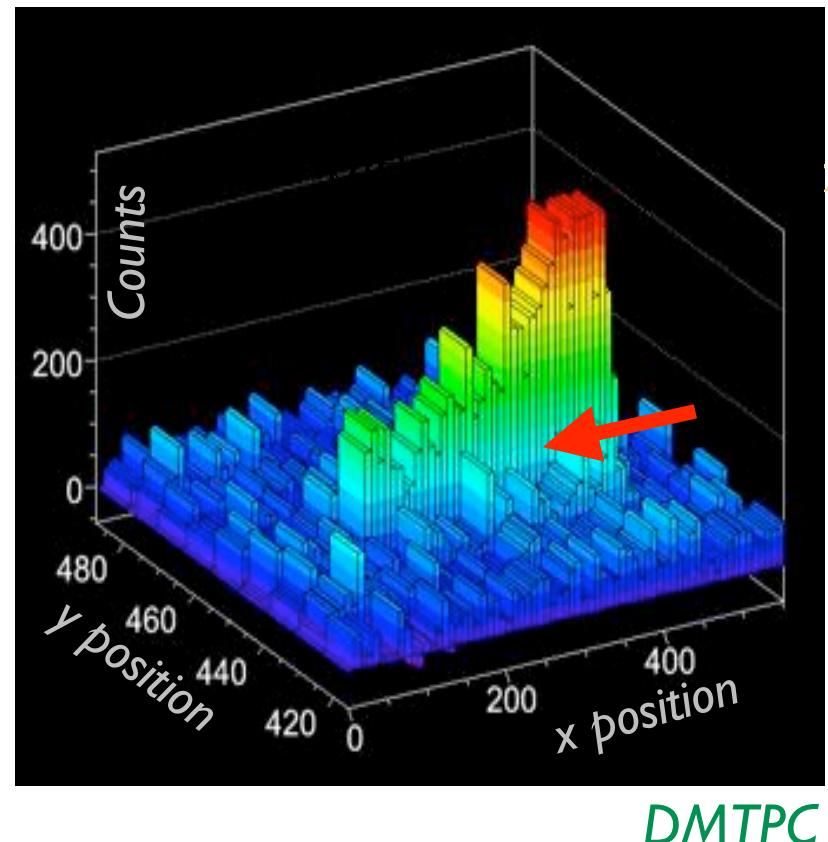

AMS (Alpha Magnetic Spectrometer)

AMS-02 can measure isotopic ratios to $\sim 1\%$ precision up to Fe and ~ 100 GeV/nucleon, and much better at lower energies.

In the next episodes.... WIMP astronomy

- Directional direct detection
 - measure direction of nuclear recoil
- Several R&D efforts
 - DRIFT
 - Dark Matter TPC
 - NEWAGE
 - MIMAC
 - D3
 - Emulsion Dark Matter Search
 - Columnar recombination

DMTPC

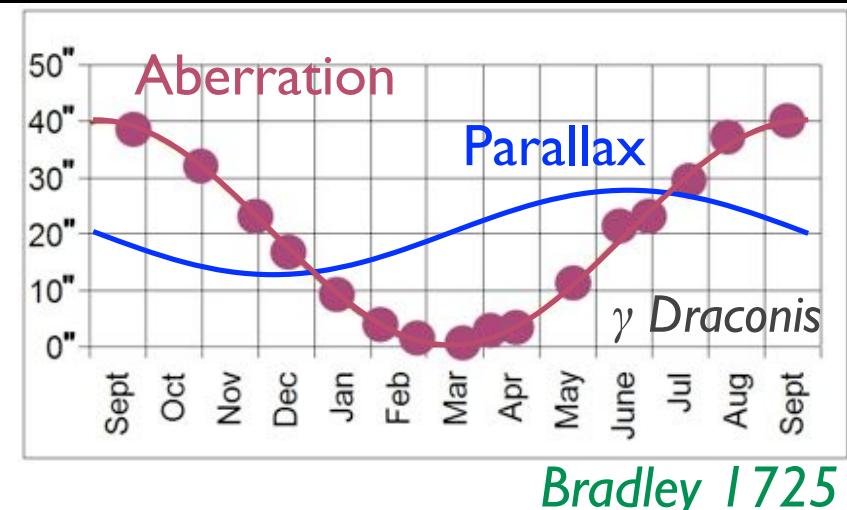

Only ~ 10 events needed to confirm extraterrestrial signal

In the next episodes.... WIMP astronomy

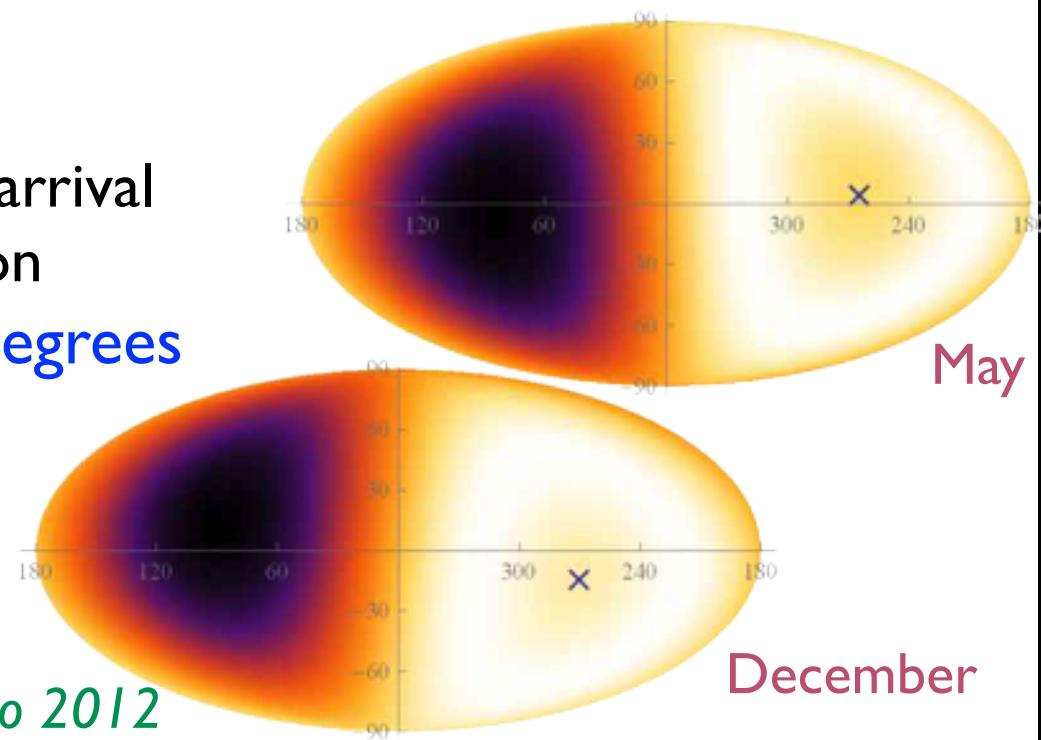

Aberration of WIMPs

Photon arrival
direction
20 arcsec

WIMP arrival
direction
10 degrees

Bozorgnia, Gelmini, Gondolo 2012

Synopsis

- Fifty shades of dark
 - *There is evidence for nonbaryonic cold dark matter.*
 - *There are many candidates for nonbaryonic dark matter particles.*
- The forbidden fruit
 - *WIMP interaction rates in direct searches are very small.*
 - *No bananas in the lab.*
- Confusion of the mind
 - *Some experiments claim dark matter detection while others exclude it.*
- That which does not kill us makes us stronger
 - *Move to consider all possible WIMP-SM currents.*
 - *Do not assume any specific dark halo model.*
